Dor: System overview, glossary and shared basics

Read this chapter first. It explains what Dor is, how a visit moves through the system, who does what, and the things every user does: signing in, choosing a language, protecting your account and understanding ticket statuses. After it, read the manual for your own role.

1. What Dor is and how a visit flows

Dor (דור) is a visitor queue system. Instead of a crowd standing in front of a counter, each visitor receives a numbered **ticket**, waits comfortably, and is called when it is their turn. The system decides which staff member serves the next visitor, shows the call on a screen and can announce it by voice.

A normal visit goes through these steps:

1. **The visitor arrives.** Some visitors have an appointment, others just walk in.
2. **A ticket is issued.** A receptionist issues it, or the visitor takes it alone from a kiosk (a self-service tablet). A visitor with an appointment is checked in by the receptionist, and the appointment becomes a ticket in the queue.
3. **The ticket waits in a queue.** Every ticket belongs to a visit reason (the service the visitor needs). The visitor can follow their place by scanning the QR code on the ticket with a phone.
4. **The distribution engine assigns it.** When an agent is free, the engine picks the next ticket for that agent using the branch rules: visit reason, priority, how long the visitor has waited and the agent's workload.
5. **The display screen and the voice call it.** The waiting-room screen shows the ticket number and the desk. If voice is enabled, it also announces the call.
6. **The agent serves the visitor.** The agent presses **Start service**, helps the visitor, then records the result.
7. **The visit is completed.** The ticket is closed. If your administrator has enabled feedback, the visitor can rate the visit on their phone.

Step	Who does it	What they do
Arrival and ticket	Receptionist, or the visitor at a kiosk	Chooses the visit reason and issues the ticket
Waiting	The visitor	Waits and follows the ticket on a phone if they want
Assignment	The distribution engine	Chooses the next ticket for each free agent, automatically
Calling	Agent, display screen, voice	The agent calls; the screen and voice announce

Step	Who does it	What they do
Service	Agent	Starts, serves, completes (or holds, transfers, marks no-show)
Follow-up	Supervisor and administrator	Watch the live wallboard, read reports, adjust settings

2. The roles in one page

Each person has one or more roles. A role decides which areas appear after you sign in. If you have several areas, Dor shows **Choose where to work**.

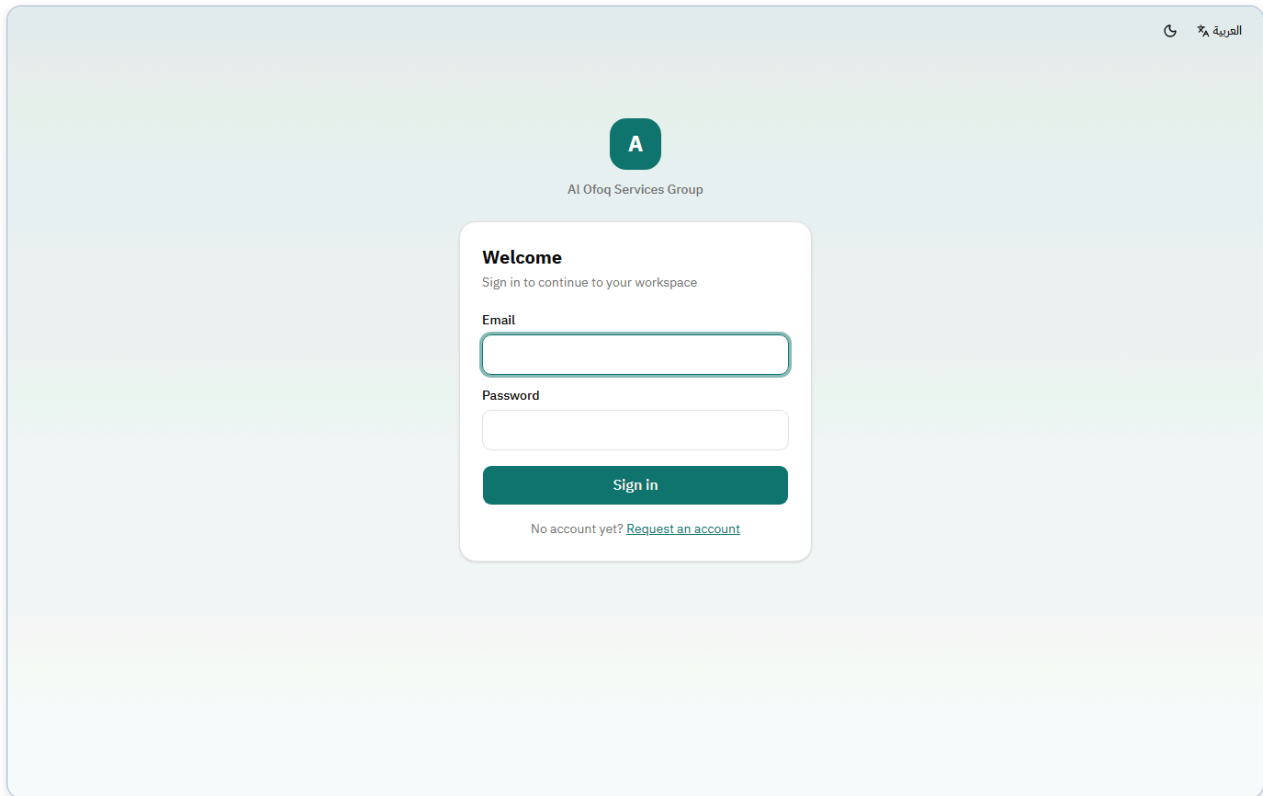

Role	What the person does	Where they work	Manual to read
Receptionist	Issues tickets for walk-in visitors, checks in appointments, edits or cancels tickets, reprints tickets	Reception	Receptionist manual
Agent	Calls and serves visitors at a desk, holds, transfers, completes tickets	Agent workspace	Agent manual
Supervisor	Watches the queue live, reacts to alerts, reads reports, may reassign tickets	Live wallboard and Reports	Supervisor manual
City Admin	Runs one city or one branch: users, branches, desks, visit reasons, screens, rules, reports	Administration	Administrator manual
Super Admin	Everything a City Admin does, for all cities, plus organization-wide settings such as cities, roles, templates and security	Administration	Administrator manual
Screen and kiosk setup	An administrator pairs the waiting-room screens and kiosks with a pairing code	Administration , then Screens	Administrator manual

Good to know:

- Receptionist, Agent, City Admin and Super Admin are the built-in roles. The supervisor is usually a custom role that your administrator builds from permissions, so its exact abilities can differ between organizations.
- A role can apply to the whole organization, to one city or to one branch.
- If you see **Access denied**, your role does not include that page. Ask an administrator.
- If you see "Your account has no workspace assigned yet", you have no role yet. Ask an administrator to give you one.

3. Shared basics

Signing in

The sign-in page

1. Open the Dor address your administrator gave you.
2. Type your **Email** and **Password**, then press **Sign in**.
3. If your email belongs to more than one organization, a new field **Organization code** appears. Enter the code and press **Sign in** again.
4. If two-step verification is on, enter the 6-digit **Verification code** and press **Verify**.

After too many wrong passwords your account is locked for a while (by default 5 attempts and 15 minutes). Wait, then try again. Sessions end automatically after some hours (12 by default), so you may need to sign in again. To leave, use **Sign out**.

Language, light and dark theme

- Dor works in Arabic and English. Use the language button (it shows the other language) in the header. When you are signed in, your choice is saved on your profile. You can also change it on the **My account** page under **Interface language**.
- The staff screens have a light/dark switch (**Switch to dark mode** / **Switch to light mode**). The first time, it follows your device setting.

Install Dor as an app (PWA)

Dor can be installed like an app on a PC, tablet or phone, with its own window and icon.

1. Open Dor in Chrome or Edge (on a phone, Chrome or Safari).
2. Use the browser's install option: the install icon in the address bar on a PC, or **Add to Home screen** / **Install app** in the browser menu on a phone.
3. Open Dor from the new icon.

The app name and colour follow your organization's branding. Installing does not make Dor work offline: it always needs the network, and only shows the last page shell for a short outage.

My account: password and two-step verification

The screenshot shows the 'My account' page of the Dor application. The header includes the organization name 'Al Ofoq Services Group', the role 'Agent workspace', and the user's name 'Khalid Al-Dimashqi' with a 'Sign out' link. The main content area is titled 'My account' and contains three sections: 'Preferences' with an 'Interface language' dropdown set to 'العربية *'; 'Change password' with three input fields for 'Current password', 'New password', and 'Confirm new password', and a 'Change password' button; and 'Two-step verification (TOTP)' with a description and an 'Enable two-step verification' button.

My account page

Open **My profile** from the header, then follow the link **Password, two-step verification and language** to reach **My account**.

Change your password

1. In **Change password**, enter the **Current password**.
2. Enter the **New password** and **Confirm new password**.
3. Save. Your other sessions are signed out.

A new password must follow the rules shown on screen. By default it needs at least 10 characters, an uppercase letter, a lowercase letter and a number, must not be a common password and must not contain the first part of your email. Your administrator can change these rules.

Turn on two-step verification

1. Install an authenticator app such as Microsoft Authenticator or Google Authenticator.
2. In **Two-step verification (TOTP)**, press **Enable two-step verification**.
3. Scan the QR code with the app. If you cannot scan, type the key shown under **Or enter this key manually**.
4. Enter the 6-digit code from the app and press **Verify**.

From then on, every sign-in asks for a code. To turn it off, enter your current password and press **Turn off**. Your administrator may require two-step verification for some roles. If you lose your phone, ask an administrator to use **Reset 2FA** on your user.

Forgot your password

Dor has no "forgot password" button on the sign-in page. Ask your administrator to open your user in **Administration**, then **Users**, and press **Reset password**. You are signed out everywhere and receive a single-use link, valid for 24 hours. If the administrator ticks **Also send by email**, the link arrives in your inbox; otherwise they pass it to you. Open the link, choose a new password and press **Save password**. If the link says it is invalid, already used or expired, ask for a new one.

Getting an account

There are two ways.

Accept an invitation. An administrator invites you from **Invitations** and sends you a link. The page says "Join" followed by your organization and the role you were invited as. Enter your name and a password, confirm it and press **Create my account**. An invitation link expires (after 72 hours by default) and works once. If it fails, ask for a new link.

Request an account yourself.

The Request an account page

1. On the sign-in page, press **Request an account**. This link appears only if your administrator allows requests.
2. Enter **Your name**, **Email**, optional **Phone**, and a password twice.
3. Press **Send request**.
4. An administrator reviews the request, chooses your role and branch, and approves it. You then receive an email and can sign in with the password you chose.

If you see "Account requests are not open", ask your administrator for an invitation.

4. Ticket statuses

A ticket is always in exactly one status. The status shows in the reception queue, the agent workspace, the wallboard and reports.

Status	Meaning	What can happen next
Appointment	The visitor has booked, but has not arrived and checked in	Checked in (becomes Waiting) or cancelled
Waiting	The ticket is in the queue for an agent	Called, put on hold, transferred, cancelled
Called	An agent called the visitor and the screen shows the number	Service started, recalled, no-show, hold, transfer, cancelled

Status	Meaning	What can happen next
Serving	The agent is serving the visitor now	Completed, put on hold, transferred
On hold	Paused, for example the visitor stepped out	Resumed (back to Waiting), transferred, cancelled
Completed	The visit is finished	Final. Can be undone for a short time after a mistake
No-show	The visitor was called but did not come	Final, unless sent back to the queue
Cancelled	The ticket was cancelled	Final. Can be undone for a short time after a mistake

Notes:

- Called and Serving tickets count towards an agent's limit of tickets at one time.
- Transfer is an action, not a status: the ticket goes back to Waiting in another service or for another agent.
- Depending on the branch policy, a no-show is either closed or sent to the end of the queue. An accidental no-show, completion or cancellation can be undone within the undo window set by your administrator (in seconds).

5. Glossary

Term	Meaning
Ticket	A numbered record of one visit, such as A-014 . The letter (the prefix) belongs to the visit reason, and the number restarts each service day
Queue	The tickets waiting for the same service in a branch
Visit reason	The service the visitor needs, such as "Account opening". It decides the queue and which agents can serve it
Desk	The counter or window where an agent serves. The screen announces the desk number
Hall / group session	A room with a fixed capacity where one host receives several visitors together. Halls are off unless the branch enables them
Branch	One physical location with its own desks, agents, screens and settings
City	A group of branches. A City Admin manages the branches of their city

Term	Meaning
Priority	A level that lets some tickets be called before others. Receptionists choose it when issuing a ticket, if priorities are set up
No-show	A visitor who was called but did not arrive
Transfer	Sending a ticket to another service or to a specific agent, with an optional note
Hold	Pausing a ticket without losing the visitor's place in history. It is resumed later
Walk-in	A visitor without an appointment
Appointment	A booked visit. The visitor gives an appointment code, and the receptionist uses Check in appointment
Display screen	The waiting-room screen that shows the current calls. It is paired with a code and needs no sign-in
Kiosk	A self-service tablet where visitors choose a service and get a ticket
Wallboard	The live operations screen for supervisors: waiting counts, agent states, long waits and alerts
CSAT	Customer satisfaction: the 1 to 5 rating a visitor can give after the visit

6. Frequently asked questions

Who can see my tickets and reports? Only people whose role allows it, and only for the branches or cities their role covers. Administrators can see more than agents.

Why do I not see a menu or page that my colleague sees? Your roles are different. You only see the areas your roles allow. Ask an administrator if you need another one.

Can I use Dor in Arabic and English at the same time? Each person uses one interface language at a time, and you can switch whenever you like. Visitor-facing text, such as the status page and the voice, follows the visitor's ticket language and the organization's voice settings.

What does the ticket number mean? It is the visit reason's letter, a separator and a number, such as **A-014** . Numbers start again at the start of each service day (at 03:00 by default, set by the administrator).

How does a visitor follow their turn? By scanning the QR code on the ticket (printed or on the reception or kiosk screen). The page shows people ahead and the estimated wait, and updates by itself.

Does the visitor get messages? On the status page the visitor can give a phone number and agree to receive updates about their turn, and can later stop the messages. Whether messages are sent also depends on your administrator's notification settings.

A visitor was called but is not here. What now? The agent can recall them and finally mark **No-show**. If it was a mistake, use Undo quickly, or ask reception to send the ticket back to the queue.

An agent steps away. Do they lose tickets? An agent who is **Busy** keeps current visitors but gets no new ones. **On break, Away** and **Offline** also stop new visitors.

I was signed out suddenly. Why? Sessions end after a set time, and changing or resetting a password signs out the other sessions. Sign in again.

My account is locked. Too many wrong passwords. The message tells you how many minutes to wait. An administrator can also help.

I lost my phone with the authenticator. Ask an administrator to **Reset 2FA** on your user, then set it up again.

The screen does not announce the call. Browsers block sound until the screen is touched once. Touch the screen when it shows "Touch the screen to enable sound", and check that sound is on. If it persists, tell your administrator.

Do I need to install anything? No. Dor runs in the browser. Installing it as an app is optional and only gives you its own window.

Who do I ask for a new account, role or branch change? Your administrator.

7. Getting help

1. Check the section for your role in its manual, especially the troubleshooting table.
2. Ask your supervisor or colleague at the same branch.
3. Contact your administrator for accounts, passwords, roles, desks, screens and settings. Give them the screen name, what you pressed and the message you saw, and the ticket number if there is one.
4. If a page says **Something went wrong**, press **Reload page** first. This often fixes it after an application update.

Dor Agent Guide

1. Who this guide is for

You are an **agent**: the staff member who serves visitors at a desk, or hosts a group of visitors in a hall. Visitors take a ticket (for example `A-014`), wait, and are called to you. You do the work with the visitor and then close the visit.

In the **Agent workspace** you can:

- Set your status (Available, Busy, On break, Away, Offline) and choose your desk.
- Call the next visitor, repeat the call, start the service and complete it.
- Mark a visitor as a no-show, put a visitor on hold, or transfer a visitor to another service or another agent.
- Serve more than one visitor at the same time, if your administrator allows it.
- Take a break, using the break types your organization has defined.
- Issue a ticket for a walk-in visitor yourself, if your administrator has enabled it.
- Host a hall session and call a group of visitors into a hall, if your branch uses halls.
- See your own progress and reports on your profile page.

2. Before you start

Signing in

1. Open the Dor address your administrator gave you.
2. Enter your **Email** and **Password**, then press **Sign in**.
3. If you use two-step verification, enter the 6-digit **Verification code** from your authenticator app and press **Verify**.
4. If the page asks for an **Organization code**, enter it. This is only needed when your email belongs to more than one organization.

After too many wrong attempts the account is locked for a few minutes. Wait for the time shown, then try again.

Open **Agent workspace** from the menu at the top of the page. If you also have other roles, the same menu shows their areas (for example Reception or Reports).

Note: If you see the message "You are not set up to serve visitors", your account has no agent profile yet. Ask your administrator to open your user and tick "Serves visitors", then choose your branch, desk and capacity.

Language and theme

At the top right of every page you will find:

- A **theme** button that switches between light and dark mode.
- A **language** button that shows the name of the other language. Press it to switch between Arabic and English.
- Your picture or initials, which open **My profile**.
- **Sign out**.

You can also change the interface language from **My account**.

Password and two-step verification

Open your profile (press your name at the top), then press **Password, two-step verification and language**. This opens **My account**.

My account

Preferences

Interface language العربية

Change password

Current password

New password

Confirm new password

Change password

Two-step verification (TOTP)

Add a second step to your sign-in using an authenticator app such as Microsoft Authenticator or Google Authenticator.

Enable two-step verification

My account page

To change your password

1. In **Change password**, enter your **Current password**.
2. Enter the **New password** twice (**New password** and **Confirm new password**).
3. Press **Change password**. If the password is too weak, the page lists what is missing (length, uppercase letter, lowercase letter, number, symbol, not a common password, must not contain your email name).

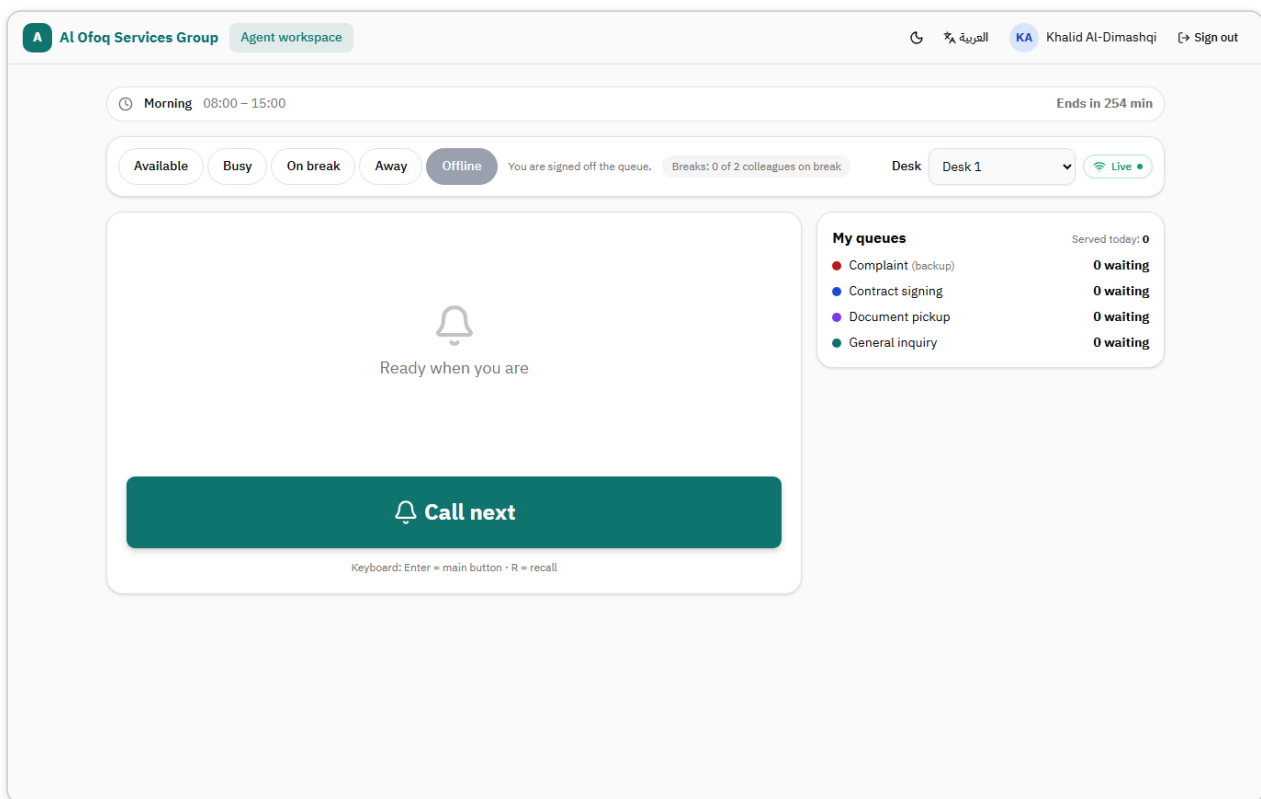

4. When it works you see "Password changed. Other sessions were signed out." You will have to sign in again on your other devices.

To turn on two-step verification

1. Install an authenticator app on your phone, such as Microsoft Authenticator or Google Authenticator.
2. In **Two-step verification (TOTP)**, press **Enable two-step verification**.
3. Scan the code shown on screen. If you cannot scan it, type the key shown under "Or enter this key manually".
4. Enter the 6-digit code from the app. You will see "Two-step verification is now on."

To switch it off, press **Turn off** in the same card.

3. Know your screen

The agent workspace

The workspace has three parts.

The status bar (top)

- **My status** buttons: **Available**, **Busy**, **On break**, **Away**, **Offline**. The sentence next to them explains the selected status.
- **Desk**: the desk you are working at.
- **New walk-in visitor** button (only if issuing is enabled for you).

- A small connection indicator. It shows **Live** while the screen receives updates, and "Reconnecting..." or an offline message when the connection is lost.
- If your branch has halls, a **Work at** switch with **Desk** and **Hall**.

The main card (left)

- Before you call anyone it shows "Ready when you are".
- When a visitor is called it shows the ticket number in large type, the status, the service (visit reason), how long the visitor **Waited**, the time since they were **Called** or since service started, and the **Visitor** details: name, phone (press it to call), company, the answers collected at the desk, and notes.
- **Visit history** shows whether this is a first or a returning visit, the date of the last visit and the earlier visits with their outcome.
- The big button at the bottom is the main action. It changes with the situation: **Call next**, **Start service**, then **Complete**.
- Smaller buttons: **Recall**, **No-show**, **Hold**, **Transfer**.

The side column (right)

- **My queues:** for each service you handle, how many visitors are waiting and how long the oldest has waited. A service marked "backup" is one you only cover when the main agents are busy. **Served today** shows your count for the day.
- **Reserved for you:** tickets that were assigned to you by name (for example by reception).
- **On hold:** visitors you have put on hold, each with a play button to bring them back.

Statuses at a glance

Status	What it means
Available	You receive new visitors.
Busy	You keep your current visitors but get no new ones.
On break	No new visitors until you are back.
Away	No new visitors until you are back.
Offline	You are signed off the queue.

4. Everyday tasks

Start your day

1. Open **Agent workspace**.
2. In **Desk**, choose your desk if it is not already selected.
3. Press **Available**. From now on the system can assign visitors to you.

Serve a visitor (call, start, complete)

1. Press **Call next**. The system picks the visitor who should be served next from the services you handle. The visitor's number is announced on the display screen.
2. If nobody is waiting, a message tells you why, for example "Nobody is waiting for your services." or "Set yourself available to call visitors." If you still have a visitor in progress and are at your limit, it says "Finish your current visitor first."
3. When the visitor comes to your desk, press **Start service**. The timer now counts the service time.
4. When you are finished, press **Complete**. A window opens:
 - **Outcome** (optional): **Resolved**, **Needs follow-up**, **Referred** or **Information given**. Press an outcome again to deselect it.
 - **Notes** (optional).
 - **Tags (comma separated)** (optional).
5. Press **Complete** in the window. You see "A-014 completed". For a few seconds the message has an **Undo** button in case you pressed it by mistake.

You can use the keyboard instead of the mouse: press **Enter** for the main button (call, start, then the Complete window). In the Complete window the Complete button is already selected, so **Enter** confirms it.

Recall a visitor who did not come

When a visitor is **Called** but has not arrived:

1. Press **Recall**, or press **R** on the keyboard. The call is repeated. The ticket shows how many times it was recalled.
2. If the visitor still does not come, press **No-show**. You see "A-014 marked as no-show" with an **Undo** button for a few seconds.

Recall and **No-show** only appear while the visitor is in the **Called** state. Once you start the service they are replaced by **Hold** and **Transfer**.

Put a visitor on hold and bring them back

1. Press **Hold** (for example when you must wait for a document).

2. The visitor moves to the **On hold** list on the right and you are free to call someone else.
3. When ready, press the play button next to the ticket in **On hold** to resume.

Transfer a visitor

Use this when the visitor needs another service or a specific colleague.

1. Press **Transfer**. The window "Transfer A-014" opens.
2. Under **Another service**, choose the new service. The current one is marked "Same service".
3. Optionally, under **A specific agent**, choose a colleague who handles that service. The list shows their status.
4. Optionally write a **Note for the next agent**.
5. Press **Transfer**. The button stays disabled until you change the service or choose an agent.

Serve several visitors at once

Your administrator sets how many visitors you may serve at the same time. If the limit is higher than one:

- A row of tabs appears above the ticket, one per visitor, each marked **Called** or **Serving**. The counter shows, for example, "2 of 3 visitors".
- Press a tab to focus on that visitor. All buttons act on the visitor in focus.
- While you are below your limit and have a visitor in focus, a **Call another visitor** button appears under the main button.
- A newly called visitor gets the focus automatically. When you complete the focused visitor, the next one takes over.

Issue a ticket for a walk-in visitor

The **New walk-in visitor** button appears only if two things are true: your role includes the permission "Issue walk-in tickets from the agent screen", and your administrator has set **Agents can issue walk-in tickets** to "Always", or to "Only when the branch has no receptionist" (and there is none). If you do not see the button, ask your administrator.

1. Press **New walk-in visitor**.
2. Choose what to do with the ticket:
 - **Serve now**: you take the visitor yourself straight away. Only the services you handle are offered. It is disabled with "You are already serving as many visitors as you can" when you are at your limit.
 - **Add to queue**: a normal ticket, called later by the next free agent. All services of the branch are offered.
3. If shown, choose the visitor's priority and language in the bar at the top of the window.
4. Choose the service.
5. Fill in the visitor details that the form asks for, accept the consent if it is required, and issue the ticket.

6. The ticket appears on screen. For **Add to queue** you see the number, how many people are ahead, the estimated wait and, if enabled, a QR code the visitor can scan to follow their place on their phone. For **Serve now** you see "You are now serving this visitor." and the visitor appears in your workspace.
7. Press **Print** to print the ticket, **Another visitor** to issue a new one, or **Close**. If this computer has no printer, tick "This computer has no printer" and show the ticket on screen instead.

Take a break

1. Press **On break**.
2. If your organization defined break types, a window **Break type** lists them. Choose one. If there is only one, or you have already chosen one in this session, the system may use it without asking.
3. While you are on break, a badge shows the break type and a running timer. You get no new visitors.
4. When you return, press **Available**.

Some branches limit how many colleagues can be on break at the same time. You then see "Breaks: 1 of 2 colleagues on break".

If the limit is reached when you ask:

1. You join a break line: "You are in the break line" with your number in the line.
2. When a place is free, a green banner appears: "A break place is free for you", with a countdown, a soft chime and a message. Press **Start my break** before the countdown ends.
3. If you change your mind, press **Cancel**. If the time runs out, you see "Your break place expired, ask again." and must ask again.

Note: The chime plays only after you have clicked or pressed a key on the page at least once, because browsers block sound until then. Keep the workspace tab open so you do not miss it.

If your administrator has set a shift for you, a bar at the top shows its name and times. When the shift is close to ending it shows "Ends in N min". Before your shift starts, depending on your branch, you either simply receive no automatic assignments until then, or you cannot go **Available** yet.

Host a hall session (group call)

This section appears only if your branch has halls. In a hall, several visitors enter together to one agent.

1. In the status bar press **Hall** next to **Work at**. The switch is locked ("Finish your current visitors first.") while you have visitors or an open session.
2. Under **Hall**, choose your hall. Each option shows its name, number and capacity.
3. The card shows the seats as "Seats 0 / 20" and how many visitors are waiting and can be called now.

4. Press **Call next group**. If your branch allows it, a stepper lets you choose the group size with the minus and plus buttons before you call. The system calls the group (for example "3 visitors called").
 - If there are not enough visitors, you see "Waiting for at least N visitors".
 - If the hall is full, you see "The hall is full."
5. The session starts as **Gathering**. The list **Visitors in the hall** shows each visitor with their status: **Called**, **Inside**, **Done**, **No-show** or **Released**. Press a visitor to see their details below.
6. As visitors arrive, press **Entered** next to each one, or **Mark all entered**.
7. For a visitor who does not come, press **No-show**. To send a visitor back to the queue at their original place, press **Release**.
8. If seats remain, press **Top up** to call more visitors into the same group.
9. Press **Start session** once at least one visitor is inside. The status becomes **In session**.
10. If the group is late, press **Recall group** to repeat the call.
11. When finished, press **Close session**. A window tells you how many visitors inside will be marked as served and how many who never entered will be marked no-show. Choose an **Outcome for everyone** (optional) and press **Close session**.
12. If nobody has entered yet, **Cancel session** is available. The called visitors go back to the queue at their original places. Press **Keep session** to go back.

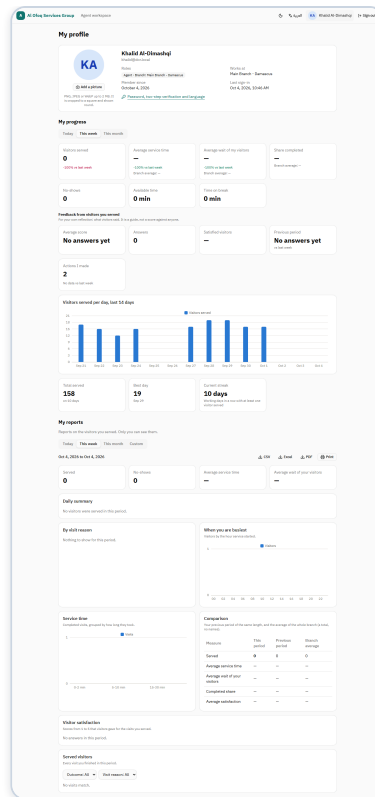

Keyboard in a hall: **Enter** = next step, **N** = call group, **E** = all entered, **S** = start, **C** = close, **R** = recall. These also work on an Arabic keyboard on the same physical keys.

Your profile, progress and reports

Press your name or picture at the top to open **My profile**.

- Page 21 / 80

My reports

To read a report:

1. Under **Period**, choose **Today**, **This week**, **This month** or **Custom**. For **Custom**, set **From** and **To** and press **Show report**. The range must be valid and not too long.
2. Read the summary figures, the **Daily summary**, **By visit reason**, **When you are busiest**, **Service time**, and **Comparison** with your previous period and the branch average (a total, with no names).
3. Under **Served visitors**, filter by **Outcome** or **Visit reason** and press **Load more** for older rows.
4. Use **Download** to save the report as **CSV**, **Excel** or **PDF**, or to **Print** it.

5. Good practice and tips

- Set yourself **Available** only when you are at your desk. Use **Busy** when you want to finish your current visitors without receiving new ones.
- Press **Recall** once or twice before **No-show**. If you press **No-show** by mistake, use **Undo** within a few seconds.
- Complete every visit as soon as it ends. It keeps the numbers on the display and in reports correct.
- Write a short note in **Notes** when the visitor will return, so the next agent has the context. Use **Transfer** with a note instead of asking the visitor to queue again.
- Look at **Visit history** before you start: it shows earlier visits and who served them.
- Keep the workspace page open and do not use two tabs for it.

- If you leave your desk, set **On break** or **Away**; do not just walk away while **Available**.
- Never share your password. Turn on two-step verification.

6. Common questions and troubleshooting

Problem	What to do
I see "You are not set up to serve visitors".	Your account has no agent profile. Ask an administrator to tick "Serves visitors" on your user.
Call next is disabled.	Choose your desk first. The button is disabled while no desk is selected.
I press Call next and nobody comes.	Read the message under the button. Either nobody is waiting for your services, or you are not Available , or you must finish your current visitor first.
The New walk-in visitor button is missing.	Ask your administrator to enable agent issuing for your branch and to give you the permission to issue walk-in tickets.
Serve now is disabled.	You are at your visitor limit. Complete one visitor first, or choose Add to queue .
I cannot go On break .	The limit of colleagues on break may be reached. You join the break line and are notified.
I missed the break notification.	The place expires. Press On break again.
I cannot go Available before my shift.	Your branch is strict about shifts. Wait for the start time shown in the message.
The Hall switch is locked.	Finish your current visitors and close the open session first.
Start session is disabled.	At least one visitor must have entered. Press Entered or Mark all entered .
The connection indicator shows "Reconnecting..." or the screen does not update.	Check your internet connection and reload the page.
I do not hear the chime.	Click anywhere on the page once and check the volume of your computer.
I forgot my password or lost my authenticator.	Contact your administrator. They can reset it for you.

7. Quick reference

Button or action	What it does
Available / Busy / On break / Away / Offline	Sets your status.
Desk	Chooses the desk you work at.
Call next	Calls the next visitor for your services.
Call another visitor	Calls one more visitor while you serve others (below your limit).
Start service	Starts the service for the called visitor.
Complete	Finishes the visit, with optional outcome, notes and tags.
Recall	Repeats the call for a called visitor. Keyboard: R .
No-show	Records that the called visitor did not come (can be undone for a few seconds).
Hold	Puts the visitor on hold; resume with the play button in On hold .
Transfer	Sends the visitor to another service or a specific agent.
New walk-in visitor	Issues a walk-in ticket: Serve now or Add to queue .
Start my break	Takes a free break place offered to you.
Desk / Hall (Work at)	Switches between desk work and hosting a hall.
Call next group	Calls a group of visitors to your hall. Keyboard: N .
Entered / Mark all entered	Records that visitors came into the hall. Keyboard: E .
Start session	Begins the hall session. Keyboard: S .
Close session	Ends the session and records the outcome. Keyboard: C .
Enter (keyboard)	The main button: call, start, complete (desk) or next step (hall).
My profile	Your picture, progress and reports.
My account	Language, password and two-step verification.

Dor Supervisor Guide

1. Who this guide is for

You are a **supervisor**. You watch the floor, spot problems early and read the reports that show how the service is doing. You do not issue tickets or serve visitors yourself. Your job is to see what is happening and tell the right people.

With the standard Supervisor role you can:

- Watch the **Live wallboard**: people waiting, desks, agent status, long waits and alerts, in real time.
- **Acknowledge alerts** when you have dealt with them.
- Open **Reports**, filter them, and download them as Excel, CSV or PDF.
- Look at the branches, desks, halls, visit reasons, users and agent groups of your organization (view only).
- Manage your own profile, language, password and two-step verification.

Note: Your administrator decides what the Supervisor role includes, and can change it. This guide describes the standard role. If a screen mentioned here is missing for you, your role does not include it. Ask your administrator.

What the standard Supervisor role does **not** include:

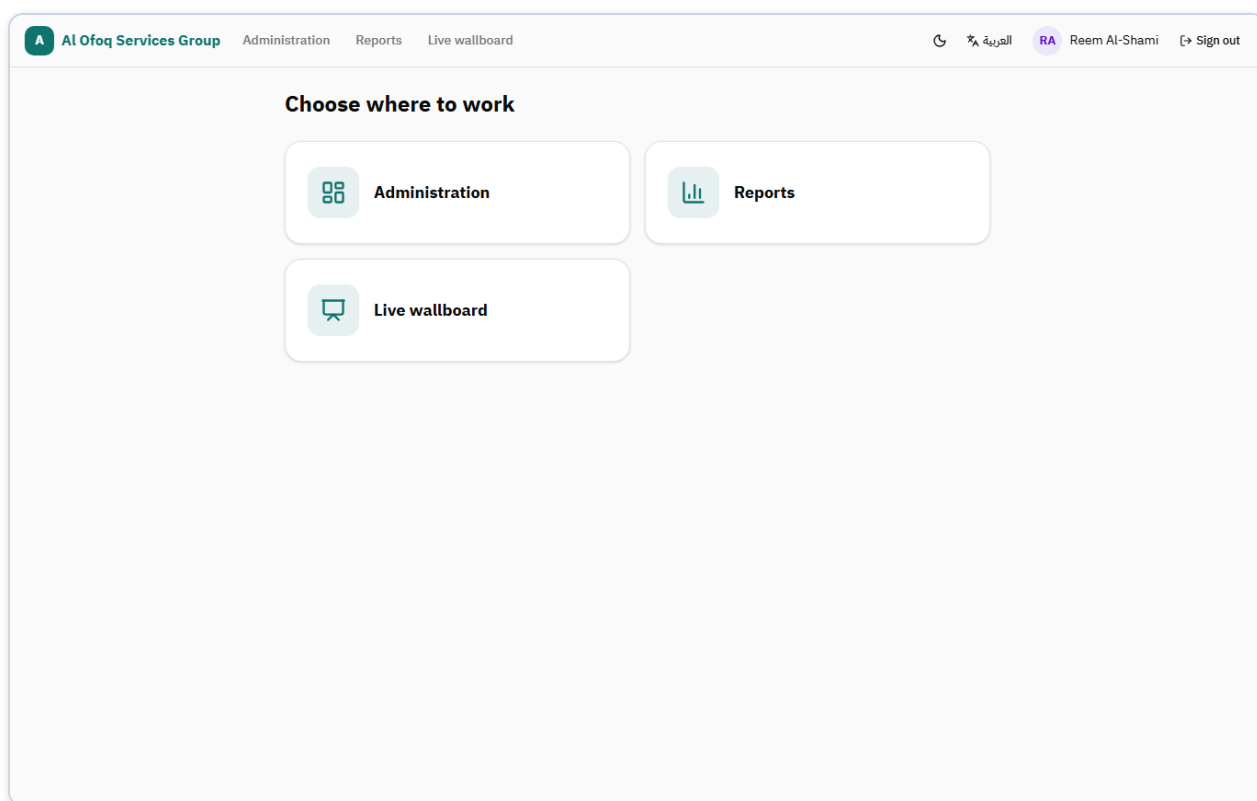

- It has no **Reception** and no **Agent workspace**. You cannot issue, cancel, edit, reprint, transfer or reassign tickets from a screen. If a visitor must be moved to another agent or a ticket must be cancelled, ask the receptionist or the agent, or ask your administrator to give you the Reception area.
- It cannot change settings, thresholds, visit reasons, users, groups or screens.
- It cannot create **scheduled reports** (the emailed reports). Ask an administrator if your team needs them.

2. Before you start

Signing in

1. Open the Dor address given by your administrator.
2. Enter your **Email** and **Password**, then press **Sign in**.
3. If two-step verification is on for your account, enter the **Verification code** from your authenticator app and press **Verify**.

After signing in you see **Choose where to work** with three tiles: **Administration**, **Reports** and **Live wallboard**. Click one. You can switch at any time with the links at the top of every page.

The page where you choose where to work

Language and theme

At the top right of every page you can change the theme (light or dark) and the language. Dor works in Arabic and English. The language you choose is remembered for your account.

Password and two-step verification

Click your name at the top right, then the link **Password, two-step verification and language**. This opens **My account**.

- **Change password:** enter the **Current password**, the **New password** and **Confirm new password**, then save. Other devices where you were signed in are signed out.
- **Two-step verification (TOTP):** press **Enable two-step verification**, scan the code with an authenticator app such as Microsoft Authenticator or Google Authenticator, then enter the 6-digit code. To remove it later, press **Turn off**.
- **Interface language:** choose Arabic or English.

My account

If you lose your phone, ask an administrator to reset your two-step verification.

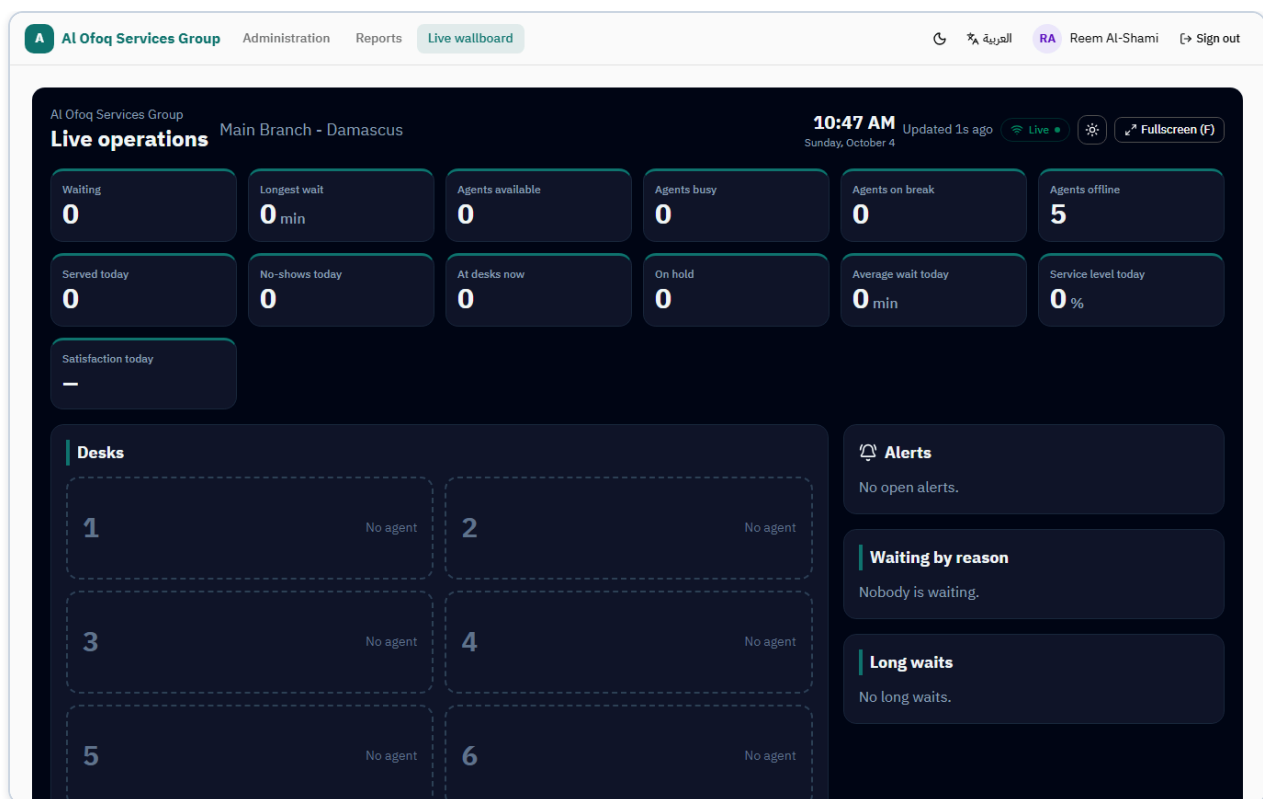

3. Know your screen

The top bar

Every page has the same bar. On the left are the areas you may open (**Administration**, **Reports**, **Live wallboard**). On the right are the theme button, the language switcher, your name (click it for **My profile**) and **Sign out**.

The Live wallboard

Open **Live wallboard**. The page title is **Live operations** (your organization may have chosen a different title). It updates by itself. The text **Updated Ns ago** shows how fresh it is, and a small connection indicator shows whether the live link is working. If data cannot be loaded you see "Could not load live data. Retrying..." and Dor keeps trying.

The live wallboard

At the top:

- **Branch** drop-down: shown only if you may see more than one branch. Pick the branch to watch.
- A clock, the theme button and **Fullscreen (F)**. Press the F key or the button to fill the screen, for example on a wall monitor. Press F again, or use **Exit fullscreen (F)**, to leave.

The tiles show today's numbers for the chosen branch:

Tile	What it tells you
Waiting	Visitors waiting for a call right now
Longest wait	How long the visitor who has waited most has been waiting, in minutes
Agents available / Agents busy / Agents on break / Agents offline	How many agents are in each state (agents who are away count as offline)
Served today	Visitors whose service is completed today
No-shows today	Visitors who were called and did not come
At desks now	Visitors called or being served at the moment
On hold	Tickets put on hold by an agent

Tile	What it tells you
Average wait today	Average time between arrival and being called
Service level today	Share of visitors called within the waiting target of their visit reason
Satisfaction today	Visitor ratings, only when visitor feedback is switched on and shown on the wallboard

Below the tiles:

- **Desks:** one card per desk, "Desk 3" and so on. It shows the agent, their status (**Available**, **Busy**, **On break**, **Away**, **Offline**) and for how many minutes they have been in it, plus the ticket they hold (for example **A-014** , **Serving**, with minutes). A desk with no one signed in shows **No agent**. If an agent has several visitors at once, all are listed.
- **Halls:** shown only when halls are used in the branch. Each hall shows **Free**, **Group called** or **In session**, the host ("Host: name" or **No host**), and how many seats are taken ("3 / 6").
- **Alerts:** open alerts (see below).
- **Waiting by reason:** one bar per visit reason with the number waiting and the longest wait. A reason that has passed its waiting target shows "over the N min target" and its bar turns red.
- **Long waits:** up to ten tickets that have waited longer than the limit set by your administrator, longest first.

The wallboard shows ticket numbers and counts only. It never shows visitor names or phone numbers.

Alerts

Dor raises an alert by itself when something looks wrong. The messages you may see:

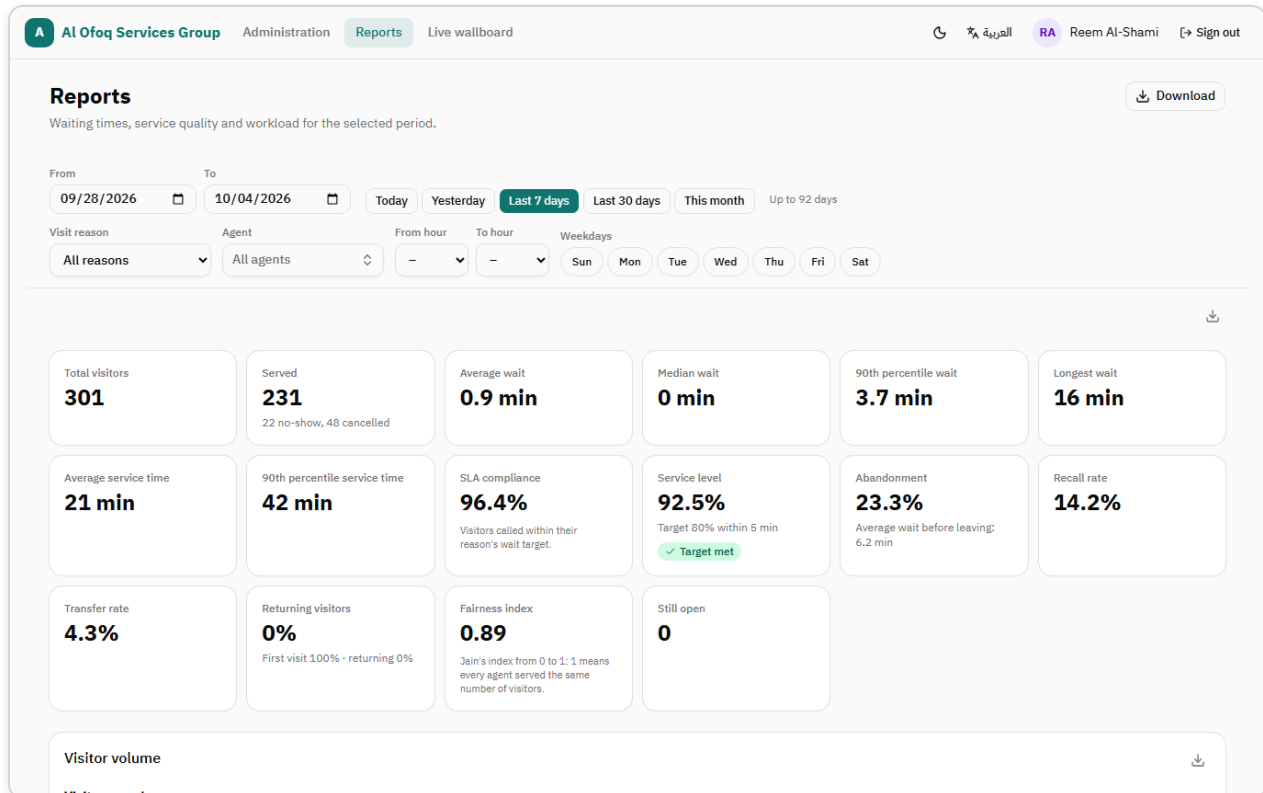

- A ticket has waited too long ("Ticket A-014 has waited 25 min (limit 20)").
- Too many people are waiting ("N people are waiting (limit M)").
- An agent has been idle while people are waiting.
- Several no-shows in a short time.
- A visitor gave a low rating, or the average satisfaction fell below the limit (only if visitor feedback is on).

When a new alert appears the page flashes briefly. If you have clicked or pressed a key on the page at least once, it also plays a short chime. The same problem is not raised again for an hour, or while its alert is still open.

The limits that trigger alerts are set by your administrator. You cannot change them.

Reports

Open **Reports**. The page is called **Reports** and says "Waiting times, service quality and workload for the selected period."

The reports page

Filters (at the top):

- **From** and **To** dates, or one of the **Date presets: Today, Yesterday, Last 7 days, Last 30 days, This month**. A period can be at most the number of days shown next to the dates.
- **Branch, Visit reason, Agent** and **Hall** (the last only where halls are used).
- **From hour** and **To hour**, and **Weekdays**.
- **Clear filters** puts everything back to the default.

The filters are kept in the page address, so you can bookmark or share a link with the filters already set.

What the report contains (sections with no data are left out):

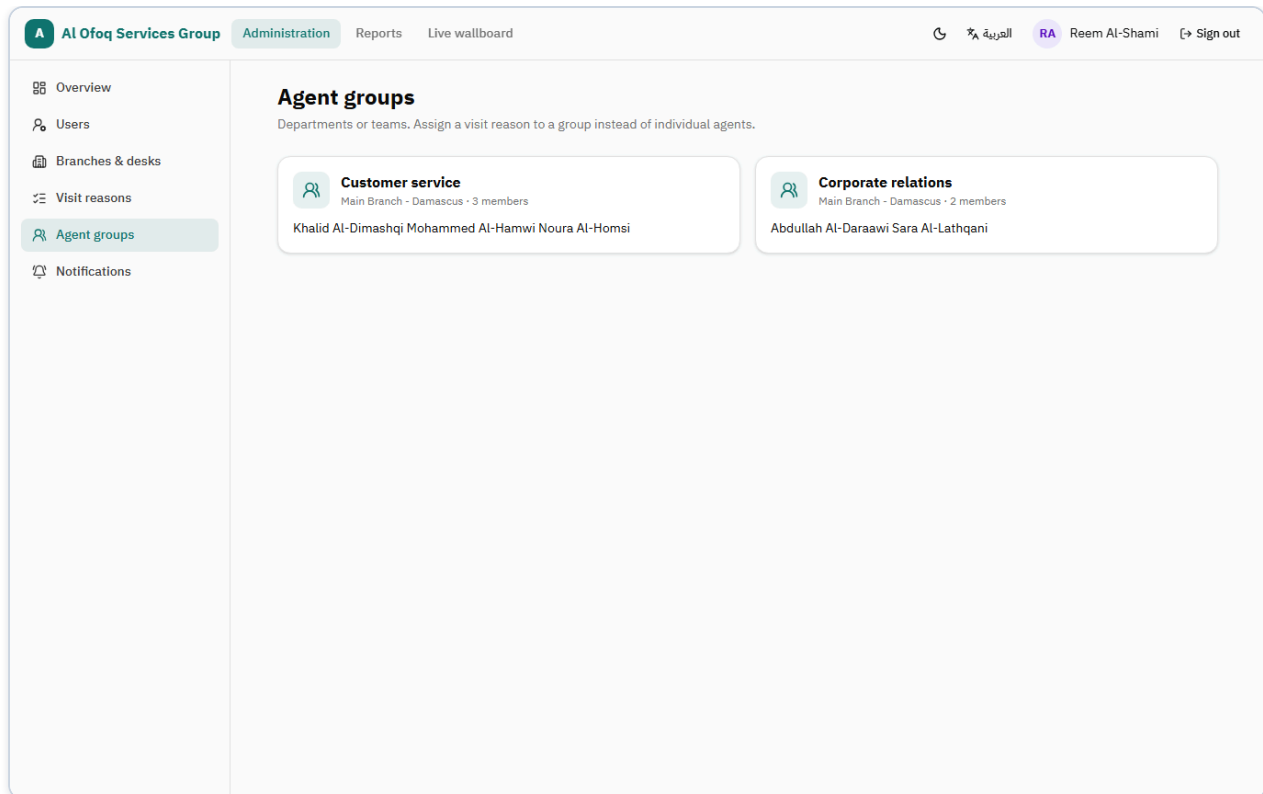

- **Key figures: Total visitors, Served** (with no-shows and cancelled), **Average wait, Median wait, 90th percentile wait, Longest wait, Average service time, SLA compliance, Service level** with **Target met** or **Below target**, **Abandonment, Recall rate, Transfer rate, Returning visitors, Fairness index** and **Still open**. With feedback on, also **Visitor satisfaction** and the recommend score.
- **Visitor volume**: visitors per day, by hour, by weekday, per branch and by visit reason.
- **How tickets were issued, By shift** and **Halls (group sessions)** where they apply.

- **Peak hours:** a weekday-by-hour map. Darker cells are busier.
- **Queue length and throughput:** people waiting by hour, visitors served per hour, still waiting at the end of the day.
- **Agents:** a table per agent with **Served, No-show, Transferred out, Transferred in, Avg service, Logged in, Break, Serving, Idle, Utilisation** and **Satisfaction**, and a chart of visitors served per agent. An even spread means work is shared fairly.
- **Visit reasons:** visitors, waits, service times and SLA per reason.
- **Visitor satisfaction** and **Repeat visits:** scores, comments on low scores and visitors who came back. A visitor's mobile number is partly hidden unless your role may see personal data.
- **Forecast:** expected visitors for the next 7 days and tomorrow by hour, with the number of agents suggested. It needs enough history. Otherwise you see "Not enough history to forecast yet."

Branches, groups and other pages

Administration opens an overview and a side menu. For the standard Supervisor role it contains these pages, all view only (the **Add** and edit buttons do not appear):

- **Overview:** counts of branches, desks, users, visit reasons and roles, and a red warning if a branch has no way to issue tickets.
- **Users:** the list of people and their roles.
- **Branches & desks:** branches, floors, desks and halls.
- **Visit reasons:** the services and their targets.
- **Agent groups:** teams of agents, each with a supervisor and members.
- **Notifications:** the visitor messages setup.

Agent groups

You are probably the **Supervisor** of one or more agent groups. This is a label for the team; it is set by an administrator.

4. Everyday tasks

Watch the floor

1. Open **Live wallboard**.
2. Pick your **Branch** if there is a drop-down.
3. Press **Fullscreen (F)** if you are showing it on a monitor.
4. Glance at **Waiting**, **Longest wait** and the red bars in **Waiting by reason**.
5. Check the **Desks**. A desk with **No agent** while many people are waiting means a counter is not open.

Respond to an alert

1. Read the alert in the **Alerts** box.
2. Act: ask an agent to open their desk, ask an agent on break to return, or ask a receptionist to check on a visitor who waits too long.
3. When it is handled, press **Acknowledge** next to the alert. It disappears for everyone.

Acknowledge only after you acted. You need the permission to acknowledge alerts; if the button is missing, tell your administrator.

Check who is on break

1. On the wallboard, look at **Agents on break**.
2. In **Desks**, find the cards that say **On break** and read how many minutes they have been so.
3. For history, open **Reports**, go to **Agents** and read **Logged in**, **Break**, **Serving** and **Idle** for each agent.

Find out why waits are long

1. Open **Reports** and choose **Today** or **Yesterday**.
2. Read **Average wait**, **90th percentile wait** and **Longest wait**.
3. Open **Peak hours** and **Queue length and throughput** to see when the queue grows.
4. In **Visit reasons**, find the reason with the highest waits.
5. In **Agents**, check **Idle**, **Utilisation** and **Transferred out**.
6. Use the **Forecast** to plan the agents needed tomorrow.

Compare agents fairly

1. Open **Reports**, and set the period.
2. In **Agents**, compare **Served**, **Avg service** and **Satisfaction**.
3. Look at the **Fairness index** in **Key figures**. A value near 1 means the work was shared evenly.
4. Use the **Agent** filter to see one person's numbers on their own.

Download a report

1. Set the filters you want. The file follows them.
2. Press **Download** (top right of the page).
3. Under **File type** choose **Excel (.xlsx)**, **CSV** or **PDF**.
4. Choose the **Sections**, either with **Quick picks (Overview, Staff and shifts, Repeat visits, Visitor satisfaction)** or by ticking sections. **Select all** and **Clear** help. Sections marked **No data** will only contain headings.
5. Press **Download**.

To download a single section, press the small download icon at the top of its card. It uses the file type you chose last.

If the file cannot be created you see "The file could not be created. Please try again in a moment."

Look up a group or a desk

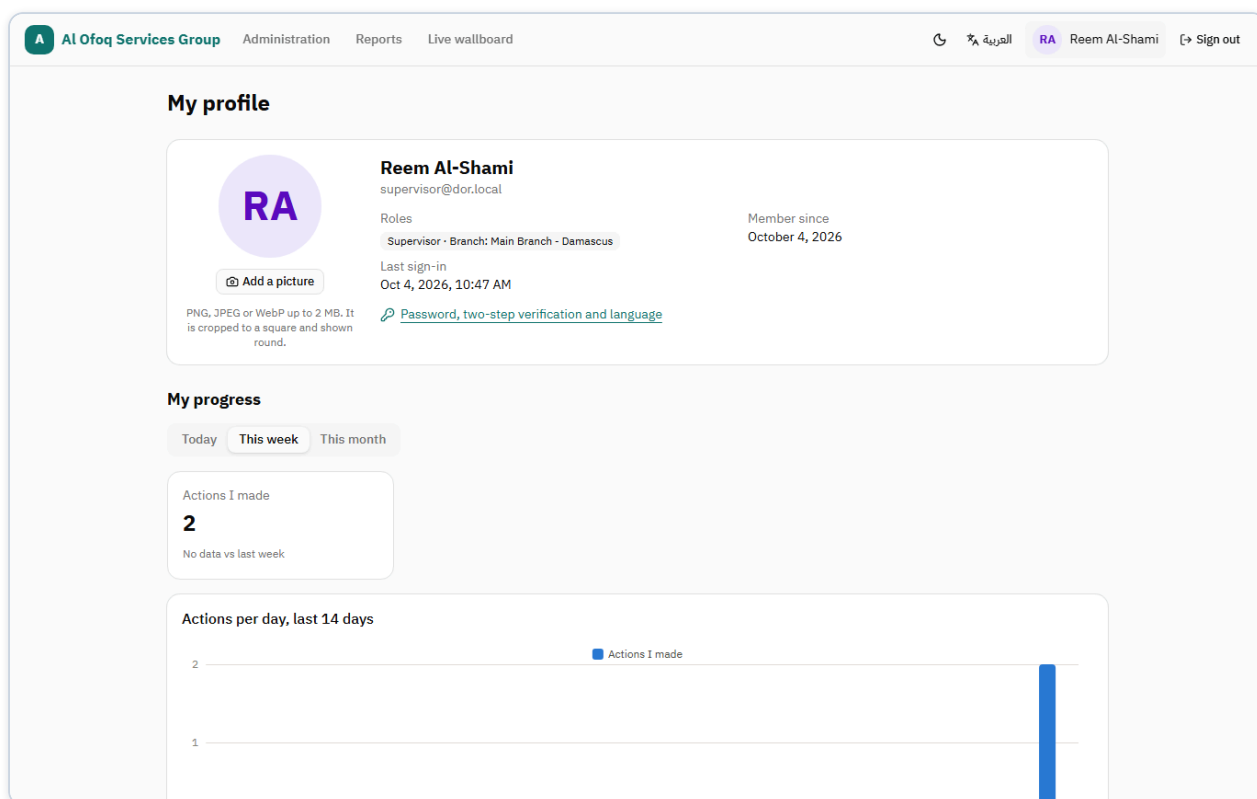

1. Open **Administration**, then **Agent groups** to see each team, its **Supervisor** and its **Members**.

2. Open **Branches & desks** to see desk numbers, floors and halls.
3. Open **Users** to find a person's roles.

If something is wrong, tell an administrator. You cannot edit these pages.

Update your profile

1. Click your name at the top right to open **My profile**.
2. To add a photo, press **Add a picture** (or **Change picture**), choose a PNG, JPEG or WebP file up to 2 MB, and press **Use this picture**. **Remove** takes it away.
3. The page also shows your **Roles**, **Member since** and **Last sign-in**, and under **My activity** the changes you made. Use the filters to choose the type and the period.
4. Use the link **Password, two-step verification and language** for your security settings.

My profile

5. Good practice and tips

- Keep the wallboard open while you supervise and watch **Longest wait**, not just the number waiting.
- Handle alerts quickly and acknowledge them, so a new alert is easy to see.
- Compare like with like: use the same period and branch when you compare two days.
- Check **Idle** and **Break** together in the agents table before drawing conclusions about an agent.
- Use the **Forecast** and **Peak hours** to ask for more agents at the right time.

- Do not share downloaded reports outside your organization. They may contain personal data in some sections.
- Sign out when you leave a shared computer.

6. Common questions and troubleshooting

Problem	What to do
I cannot see Reports or Live wallboard at the top.	Your role does not include it. Ask an administrator.
A page says Access denied .	Your role does not include that page. Ask an administrator if you need it.
I need to move a visitor to another agent or cancel a ticket.	The standard Supervisor role has no screen for this. Ask the receptionist or the agent, or ask an administrator to add the Reception area to your role.
There is no Acknowledge button.	Your role cannot acknowledge alerts. Ask an administrator.
The wallboard shows "Could not load live data. Retrying..."	Check your connection. Dor retries on its own. Reload the page if it continues.
Updated Ns ago keeps growing.	The live link is broken. Reload the page.
There is no chime for a new alert.	Click anywhere on the page once. Browsers allow sound only after you interact with the page.
I do not see a Branch drop-down.	You may see only one branch.
The report says "No visitors in the selected period and filters."	Widen the dates or press Clear filters .
Forecast says "Not enough history to forecast yet."	The branch has too little past data. It improves over time.
The download fails.	Try again. If it still fails, try fewer sections or another file type.
I cannot find Scheduled reports .	Your role cannot create them. Ask an administrator.
Visitor numbers in the reports are partly hidden.	Your role is not allowed to see personal data. This is intended.
I lost my phone for two-step verification.	Ask an administrator to reset it, then enable it again from My account .

7. Quick reference

Where	Action	What it does
Wallboard	Branch	Chooses which branch you watch
Wallboard	Fullscreen (F)	Fills the screen; press F again to leave
Wallboard	Theme button	Switches the wallboard between light and dark for you
Wallboard	Acknowledge	Closes an alert you have handled
Reports	Date presets	Today, Yesterday, Last 7 days, Last 30 days, This month
Reports	Branch, Visit reason, Agent, Hall, hours, Weekdays	Narrow the report
Reports	Clear filters	Resets the filters
Reports	Download	Opens the dialog to get Excel, CSV or PDF
Reports	Download icon on a card	Downloads only that section
Administration	Agent groups, Branches & desks, Users	View teams, desks and people (read only)
Top bar	Your name	Opens My profile
My account	Change password	Sets a new password
My account	Enable two-step verification	Adds a code from an authenticator app at sign-in
Top bar	Sign out	Ends your session

Dor Receptionist Guide

Who this guide is for

You work at the reception desk. Visitors arrive, you find out why they came, and you give them a ticket with a number. Dor then puts them in the line and calls them when an agent is free. You can also print the ticket, check in a visitor who booked an appointment, and help a visitor whose ticket needs a change.

With the Receptionist role you can:

- Issue a ticket for a visit reason, with priority, language and visitor details.
- Print a ticket, or print it again later.
- Check in a visitor who has an appointment.
- See the live queue of your branch and search it.
- Edit a ticket (priority and notes), put it on hold, or cancel it.

You cannot change settings, users, visit reasons or reports. Those belong to the administrator. If a button described here is missing on your screen, your administrator has not given your role that permission.

Before you start

Signing in

1. Open the Dor address your administrator gave you.
2. Type your **Email** and your **Password**, then press **Sign in**.
3. If your organization uses two-step verification, type the 6-digit code from your authenticator app in **Verification code** and press **Verify**.
4. You land on the **Reception** screen.

If the email belongs to more than one organization, Dor asks for the **Organization code**. Ask your administrator for it.

After several wrong passwords your account is locked for a few minutes. Wait for the time shown on the screen, then try again.

If you have no account yet, press **Request an account** on the sign-in page. An administrator must approve the request.

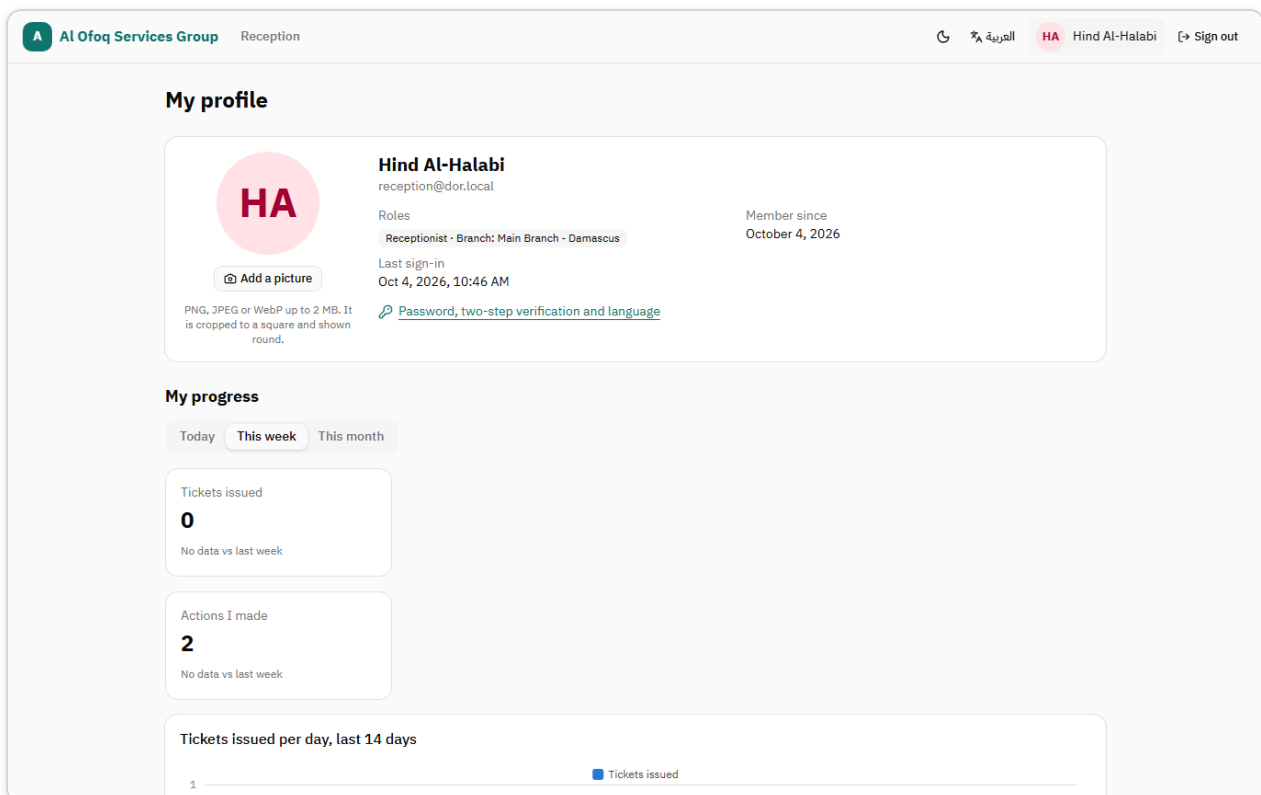

Language and theme

- At the top of every page there are two small buttons next to your name: one for the **Colour theme** (light or dark) and one for the **Language** (Arabic or English). The page changes at once.
- This is your own screen language. The language of the visitor's ticket is a separate choice, described below.

Password and two-step verification

1. Press your name at the top of the page. This opens **My profile**.
2. Press **Password, two-step verification and language**. This opens **My account**.
3. Under **Change password**, type the **Current password**, the **New password**, and the new password again in **Confirm new password**. Press the save button.
4. Dor tells you which rules the new password must meet (for example length, a capital letter, a number). When it works, you see "Password changed. Other sessions were signed out."
5. In the same page you can turn **Two-step verification (TOTP)** on or off, and change the **Interface language**.

Tip: Never share your password. Press **Sign out** (top corner) when you leave the desk, so nobody issues tickets under your name.

My account page

Know your screen

The Reception screen has one purpose: to issue a ticket in as few taps as possible.

The reception console

Top line

- **Branch:** a drop-down, shown only if you work in more than one branch. Dor remembers your last choice on this computer.
- A **Live / Reconnecting...** / **Offline** badge shows if the screen is receiving updates. If it says offline, the screen shows the last known state.
- **Waiting, Serving** and **Agents available:** three live counters for the branch.
- **Print automatically:** a tick box. See "Printing" below.
- **Check in appointment:** opens the appointment check-in window.

Left side

- A bar with **Priority** buttons and **Visitor language** buttons (your administrator can hide either one).
- **Choose the visit reason:** one large button for each reason. Each button shows the reason name, its letter prefix (for example A), and how many people are waiting for it. Popular reasons come first. A small key on the corner of a button is its keyboard shortcut. A search box (**Search reasons...**) finds a reason by name or prefix.
- Below the buttons, when a reason needs details, the form opens with the **Issue ticket** button.

Right side: Live queue

The list of today's tickets for the branch, with tabs **Active**, **Waiting**, **Called / serving**, **Finished** and **All**, and a box **Search by number, name or phone....** Each row shows the number, the visitor name or reason, a priority tag if any, how many are ahead, who is serving, how long the visitor has been there, and a status badge. The three-dot button on the row opens the actions menu.

The screenshot shows a software interface for a reception desk. At the top, there's a header with 'Al Ofoq Services Group', a 'Reception' tab, and user information for 'Hind Al-Halabi'. Below the header, the main area is titled 'Reception' and includes a 'Live' status indicator. On the right, there are statistics: 'Waiting: 0', 'Serving: 0', and 'Agents available: 0'. There are also checkboxes for 'Print automatically' and 'Check in appointment'. The interface features several filter buttons: 'Priority' (with sub-options like VIP / Guest, Elderly, etc.), 'Urgent', and 'Visitor language' (Arabic, English). A section titled 'Choose the visit reason' displays five options: 'General inquiry' (A), 'Contract signing' (B), 'Document pickup' (D), 'Complaint' (C), and 'Meeting with account manager' (E). Each option shows 'none waiting'. On the right side, there is a 'Live queue' section with tabs for 'Active', 'Waiting', 'Called / serving', 'Finished', and 'All'. It includes a search bar 'Search by number, name or phone...' and a message 'No tickets yet today.'

The live queue

Everyday tasks

Issue a ticket (the usual way)

1. Greet the visitor and ask why they came.
2. If the visitor needs special priority, press the matching **Priority** button first (for example for elderly or VIP visitors; the names depend on your organization). Press it again to switch it off. After each ticket, the priority goes back to normal by itself.
3. If the visitor prefers another language, press **Arabic** or **English** under **Visitor language**. This language is kept for the next tickets until you change it.
4. Press the visit reason button (or press its shortcut key).
5. Two things can happen:
 - If the reason needs nothing typed, the ticket is issued at once.
 - If it needs details, the form opens. Fill in the fields marked with a red star, then press **Issue ticket**.

6. Dor shows the new number, how many people are ahead, and the estimated wait. Tell the visitor the number or hand over the printed ticket.

If your administrator chose the "big confirmation" style, a window **Ticket issued** opens with a very large number. Press **New ticket** (or Enter) to continue. Otherwise a small green strip with the number appears at the top and disappears after a few seconds, and you can press the next reason straight away.

Warning: Press **Issue ticket** only once. If the network is slow, wait. Dor protects against a duplicate when you retry, but a second visitor must get a second ticket on purpose.

Visitor details, phone number and consent

Each reason has its own fields. The common ones are **Visitor name**, **Mobile number**, **Company**, **Email**, **Last 4 digits of ID** and **Notes**.

- Fields with a red star are required. Press **Add details (optional)** to see the others.
- A mobile number lets Dor recognize a returning visitor and show their history to the agent. It also lets Dor send messages about the turn (see "What the visitor receives").
- If you type any personal detail and your organization requires consent, a **Consent** tick box appears with a sentence in the visitor's language. Read it to the visitor, or let them read it. Tick it only when they agree. **Issue ticket** stays grey until it is ticked.
- If a field is missing or wrong, a red message tells you which one ("Please fill in: ...").

Note: If you issue with one tap and a required detail turns out to be missing, Dor opens the form for you instead of failing.

Choose who serves the visitor

For most reasons you do nothing: the next free agent calls the ticket. For some reasons your administrator uses manual assignment. Then the form shows **Assign to agent**. Choose an agent, or leave **Next available agent**. This list also appears for you when your role has the reassign permission.

Calling visitors by the last digits of their phone number

If your administrator turned on **Call visitors by the last digits of their phone number** (**Settings > Tickets**), a **Visitor phone number** field appears above the visit reasons. This is for desks with no ticket printer.

1. Type the visitor's phone number in **Visitor phone number**. The line next to it shows how it will be called, for example **Will be called as 472**.
2. Choose the visit reason as usual.
3. The confirmation shows the ticket number and **Will be called by the last digits of the phone**. Tell the visitor to listen for those digits.

4. When the turn comes, the screens show **Phone ending in 472** and the voice reads the digits one by one.

Note: Only the last digits are kept, not the full number. If the field is empty or too short, the ticket is not issued and the message **Type the visitor's phone number first.** appears.

Tip: If another visitor in the line already has the same last digits, you get **Another visitor in the line has a phone number ending in the same digits. Ask for another number.** Ask the visitor for a different number (for example a relative's).

Print a ticket

Tickets print on a thermal receipt printer (80 mm). The printed ticket shows:

- the logo or company name, the ticket number in large digits, and the visit reason;
- the estimated wait, as your organization worded it;
- a QR code that opens the visitor's status page on their phone (if enabled);
- a Wi-Fi name, password and QR code (if your branch offers Wi-Fi);
- a footer and the date and time.

The ticket prints in the **visitor's language**, not yours.

How printing starts:

- With **Print automatically** ticked, the print window opens after every ticket.
- With it unticked, press **Print** on the green strip or in the confirmation window.
- To print an old ticket again, open its three-dot menu in the live queue and choose **Reprint**.

If this computer has no printer: untick **Print automatically** (the box is also in the confirmation window). The choice is remembered on this computer only; other reception computers keep their own. Then read the number to the visitor, show it on screen, or let them scan the QR code. Your administrator sets the default for new computers.

Tip: If the print window opens each time and you want it silent, ask your technician to start the browser in kiosk-printing mode.

Check in an appointment

1. Press **Check in appointment** at the top.
2. Type the **Appointment code** the visitor shows (letters and numbers, at least 3 characters). Press **Find**.
3. If found, Dor shows the reason, the date and time, and the visitor name.
4. Press **Check in and issue ticket**. The form opens for that reason, with the appointment linked.
5. Fill in what is needed and press **Issue ticket**. In the live queue the ticket carries an **Appointment** mark.

Messages you may see: "No appointment with this code." (check the code) and "This appointment was already checked in." (a ticket already exists; search the live queue).

Help a visitor with an existing ticket

Open the three-dot menu on the visitor's row in the live queue. The choices you can see depend on your permissions and the ticket status.

Action	When to use it
Reprint	The visitor lost the paper ticket.
Edit	Change the Priority or the Notes of a ticket that is still active.
Assign	Send a waiting ticket to a particular agent, or press Release to everyone to remove the assignment.
Visitor stepped out	A waiting visitor must leave for a moment. The ticket goes on hold so it is not called.
Visitor is back	The visitor returned. The ticket is waiting again.
Cancel ticket	The visitor left or no longer needs the service.

After **Cancel ticket**, a message "Ticket ... cancelled" appears with **Undo** for about 8 seconds. Press **Undo** if you cancelled by mistake.

To find a ticket quickly, type the number, the name or the phone in **Search by number, name or phone....** Use the tabs to see only waiting, called or finished tickets.

Note: A visitor who needs a new ticket for a different reason gets a new ticket. Cancel the old one if it is no longer needed. There is no "convert" button.

Switch branch

If you work in more than one branch, choose the branch in the **Branch** list at the top. The reasons and the queue change to that branch.

What the visitor sees and receives

The status page on the phone

When the visitor scans the QR code on the ticket, their phone opens a page with no login. It shows:

- the branch, the visit reason and the ticket number in big digits;

- **People ahead of you** and the estimated wait (only while the visitor is waiting);
- a message: "Please wait, we will call you";
- when called: "It's your turn! Please go to" and the desk name, with a colour change;
- while served: "You are being served"; at the end: "Thank you for your visit";
- if the ticket is on hold, cancelled or missed: a message asking the visitor to speak to reception.

The page updates by itself every few seconds and opens in the language chosen at reception. If your administrator has switched the page off, the visitor sees "This ticket was not found or the page is turned off." and the printed ticket has no QR code.

If the visitor gave no phone number, the page can show **Get updates on your phone**: the visitor types a number, ticks the agreement and presses **Send me updates**. This appears only when a message channel is configured.

Messages (WhatsApp, SMS, email)

If your administrator turned notifications on, a visitor with a phone number or email can receive messages such as: number issued with a link to follow the line, your turn is near, you are called to the desk, you missed your call, and a thank-you after the visit. Dor tries WhatsApp first, then SMS, then email, as set by the administrator.

Messages are sent only with consent when your organization requires it. This is why the consent tick box matters at reception.

Stopping messages

Every SMS and email can include a link to a page **Stop messages**. The visitor presses **Yes, stop messages** and receives nothing more. You cannot do this for them from reception. If a visitor asks to stop and has no message, tell them to use the link in the last message, or ask your administrator (privacy requests belong to the administrator).

Feedback

After a visit is completed, the status page can show **How was your visit?** with faces or stars from 1 to 5, an optional comment, and sometimes a recommendation question. A feedback link can also arrive in the thank-you message. Visitors answer once. You do not see or enter the answers at reception.

Groups and halls

Some visits are received with a group in a hall. You issue these tickets in the same way. The visitor then sees "Please wait. You will be called together with a group to the hall." and, when called, the hall number instead of a desk. There are no special reception buttons for halls.

The self check-in kiosk (from your side)

Your branch may have a tablet where visitors take their own ticket. You do not operate it, but you may be asked about it.

1. The visitor picks a language, then touches the service they need.
2. If the service asks for details (name, mobile number, and so on), the visitor types them on the keypad. Details the kiosk may not ask for (for example the last 4 digits of ID) make the service a staff-only one.
3. The visitor presses **Get my number**. The screen shows **Your number**, how many are ahead, and a QR code to follow the line. The ticket can also print.
4. After a few seconds the kiosk returns to the start.

A service marked "needs staff" shows **Please ask the agent**: send the visitor to your desk. If the line is full, or the connection fails, the kiosk shows a message asking the visitor to see the staff. If the kiosk shows "Self check-in is not available here", issue the ticket yourself.

The tickets issued at the kiosk appear in your live queue like any other. Pairing and settings for kiosks are done by the administrator.

Good practice and tips

- Keep the reason buttons in front of you. Learn the shortcut keys of the busiest reasons. Press **Esc** to clear a selection.
- Choose the priority before the reason. It resets to normal after each ticket, so the next visitor is not marked by mistake.
- Ask for a mobile number every time. It gives the visitor updates and helps the agent.
- Say the ticket number and where to wait. Point to the display screen.
- Watch the **Waiting** and **Agents available** counters. If many wait and no agent is available, tell your supervisor.
- Search the live queue before issuing a second ticket to a visitor who says they already have one.
- Do not type secrets or unnecessary personal data in **Notes**.

Common questions and troubleshooting

Problem	What to do
The page says Access denied	Your role does not include this page. Ask your administrator.
No reception area appears after sign-in	No role is assigned to you yet. Ask an administrator.

Problem	What to do
Offline: showing the last known state	The connection dropped. Check the network. The screen updates by itself when it returns.
Issue ticket is grey	Tick the Consent box, or fill in the required fields.
"The ticket numbers for today are used up for this service."	The number range of this reason for the day is finished. Tell your administrator.
"The line is full right now."	The branch reached its waiting limit. Ask your supervisor.
The print window does not open	Check that Print automatically is ticked, or press Print . Check that the printer is the default one for the browser.
The computer has no printer	Untick Print automatically and use the on-screen number or the QR code.
The QR code is not on the ticket	The administrator switched it off, or the visitor page is off.
I issued a ticket to the wrong reason	Cancel it (use Undo if just done) and issue a new one.
The visitor lost the ticket	Search for them in the live queue and choose Reprint .
"No appointment with this code."	Check the code with the visitor. Letters are turned to capitals for you.
A reason I need is missing	It may not be offered at your branch. Ask your administrator.
I cannot see Check in appointment, Edit or Cancel ticket	Your role does not have that permission. Ask your administrator.
The visitor wants no more messages	Tell them to press the stop link in the message.

Quick reference

Button or action	What it does
Reason button	Issues a ticket at once, or opens the form if details are needed
Priority buttons	Mark the next ticket as priority, until it is issued
Visitor language	Language of the printed ticket and the status page
Issue ticket	Creates the ticket from the form
New ticket	Closes the confirmation window
Print	Prints the last ticket

Button or action	What it does
Print automatically	Prints after each ticket, on this computer
Check in appointment	Finds an appointment by its code
Check in and issue ticket	Issues the ticket for the found appointment
Reprint	Prints an existing ticket again
Edit	Changes priority or notes
Assign	Gives a waiting ticket to an agent
Visitor stepped out / Visitor is back	Holds or resumes a waiting ticket
Cancel ticket	Cancels a ticket; Undo brings it back for a few seconds
Search by number, name or phone...	Finds a ticket in the live queue
Sign out	Ends your session

Dor Administrator Guide

1. Who this guide is for

This guide is for the people who set up and run Dor: the **Super admin** of the whole organization and the **City admin** of one city. You decide how many cities, branches and desks exist, which services visitors can ask for, who works where, how tickets reach agents, and how the system looks and behaves.

There are two administrator roles. They use the same screens, but they do not see the same things.

	Super admin	City admin
Scope	The whole organization: every city and branch	Only the city (or branches) the role was given for
Cities	Creates, edits and archives cities	Cannot open the Cities page
Roles	Creates, edits and clones roles	Can view roles only
Settings	Every section, at organization, city and branch level	Only the sections a city or branch may override, for their own city and branches
Notifications	Channel status, test messages, limits, message wording	Branch-level event choices and the delivery log
Users	Can give any role, including organization-wide ones	Can only give roles and scopes they hold themselves
Backup status	Sees the Database backup card on the Overview	Does not see it

Your sidebar only shows the pages your role allows. If a page described here is missing, your role does not include it.

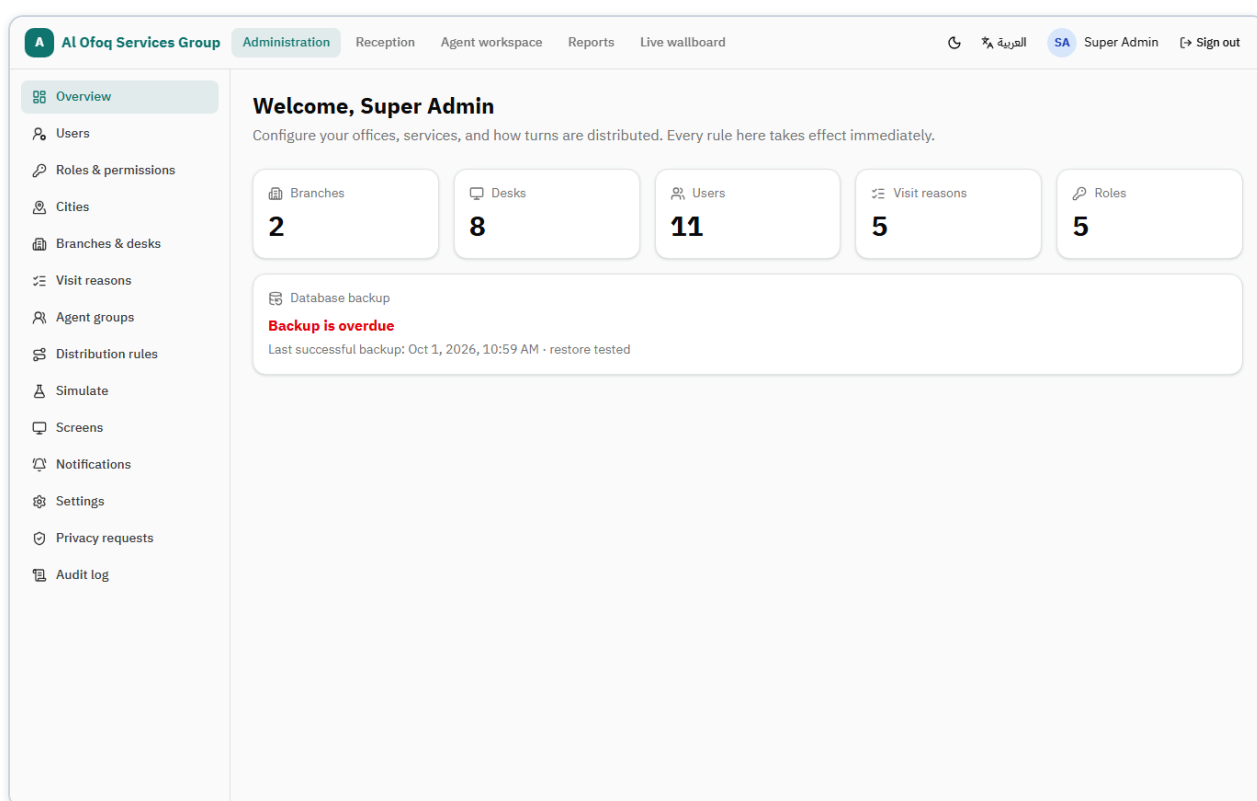

Note: Every change an administrator makes takes effect immediately and is written to the **Audit log**. There is nothing to restart.

2. Before you start

1. Open Dor in your browser and enter your **Email** and **Password**, then press **Sign in**. If the sign-in page asks for an **Organization code**, enter it too.

2. If two-step verification is on for your account, type the 6-digit code from your authenticator app and press **Verify**.
3. Press your name at the top of the page to open **My profile**, then follow the link **Password, two-step verification and language**. There you can **Change password**, set the **Interface language** (Arabic or English) and turn on two-step verification with an authenticator app. The light or dark theme can be switched from the top bar.
4. If your account has several workspaces, the top bar shows them as links. Pick **Administration**.

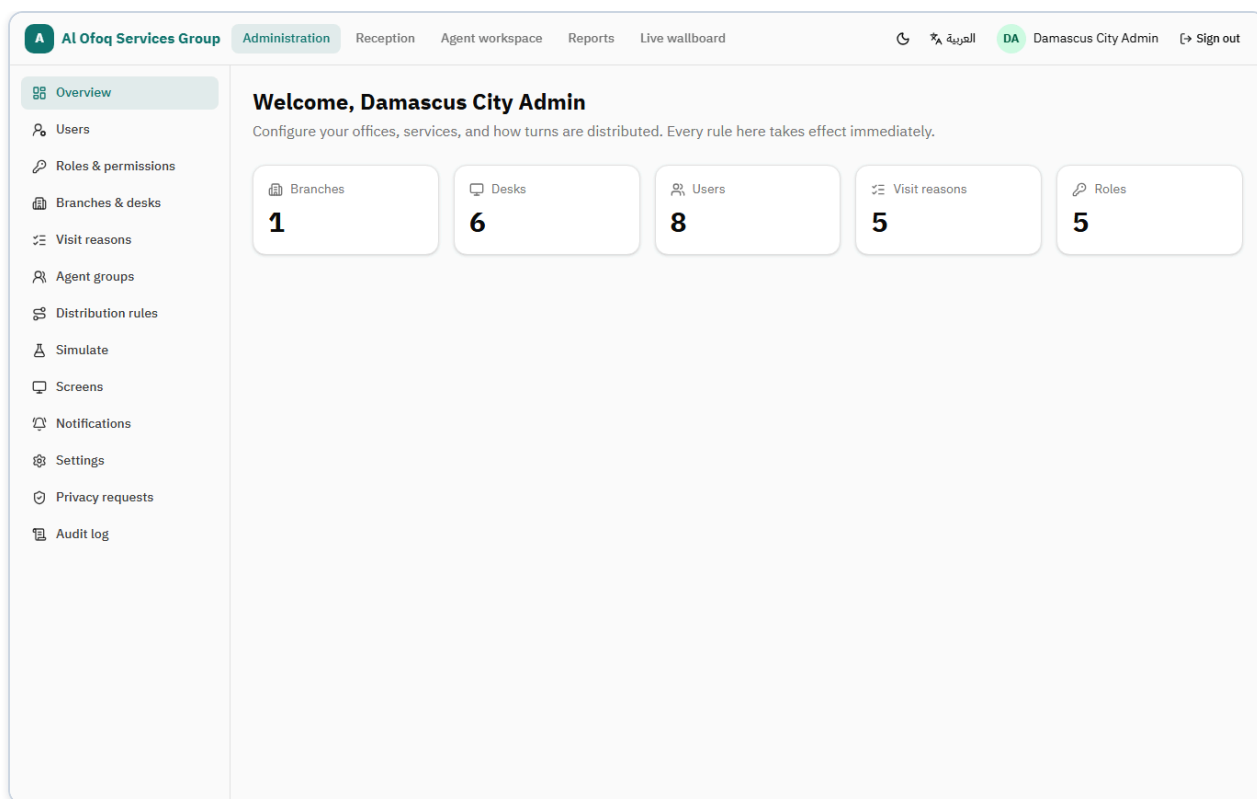

Tip: Turn on two-step verification for every administrator account. In **Settings > Security** you can make it compulsory for whole roles.

The Overview page of the super admin

3. Know your screen

The **Overview** is the first page. It greets you and shows five counters: **Branches**, **Desks**, **Users**, **Visit reasons** and **Roles**. For a city admin the counters count only their own city.

The Overview page of a city admin: fewer pages in the sidebar

Under the counters you may see warning cards:

- A **coverage** card appears when some branches have no way to issue tickets (no receptionist, agent walk-in issuing off and no kiosk paired). It has an **Open branches** button.
- A second card appears when a branch has services served in halls but nobody can serve them. It has an **Open settings** button.
- The **Database backup** card (super admin only) shows **Backed up**, **Backup is overdue**, **Last backup failed** or **No backup recorded**.

The sidebar lists the admin pages:

Page	What it is for
Overview	Counters and warnings
Users	People who sign in, Invitations and account Requests
Roles & permissions	What each role may do
Cities	Cities and their configuration (super admin)
Branches & desks	Branches, floors, desks and halls
Visit reasons	The services visitors come for

Page	What it is for
Agent groups	Teams of agents
Distribution rules	How tickets reach agents
Simulate	Test rules on a replayed day
Screens	Waiting-room screens, kiosks, announcements, voice (see the screens guide)
Notifications	WhatsApp, SMS and email to visitors
Settings	All options
Privacy requests	Export or erase a visitor's data
Audit log	Who changed what, and when

Reports and the live wallboard are separate workspaces in the top bar, not part of the Administration sidebar.

4. Everyday tasks

4.1 First-time setup: the right order

Set things up in this order, because each step needs the one before it.

1. **Branding: Settings > Branding.** Set the **Company name**, upload the **Logo**, choose colours.
2. **Cities** (super admin): add each city.
3. **Branches and desks:** add branches, floors and desks. Add halls if you use them.
4. **Visit reasons:** define each service, its ticket prefix, the data to collect, and who serves it.
5. **Users and agents:** create the people, give them roles, set up agents.
6. **Agent groups** (optional): put agents in teams.
7. **Shifts: Settings > Agents.**
8. **Distribution rules:** choose how tickets reach agents, and test with **Simulate**.
9. **Settings review:** numbering, reception, wait estimate, security, privacy, notifications.
10. **Screens, voice and kiosks:** follow the screens guide.

The **Going live checklist** at the end of this guide repeats the essentials.

4.2 Add a city (super admin)

1. Open **Cities** and press **Add city**.

2. Enter the name in Arabic and English and a **Code** (letters A-Z, digits, hyphen and underscore, for example **DAM**).
3. Save. The city appears as a card showing how many branches it has.

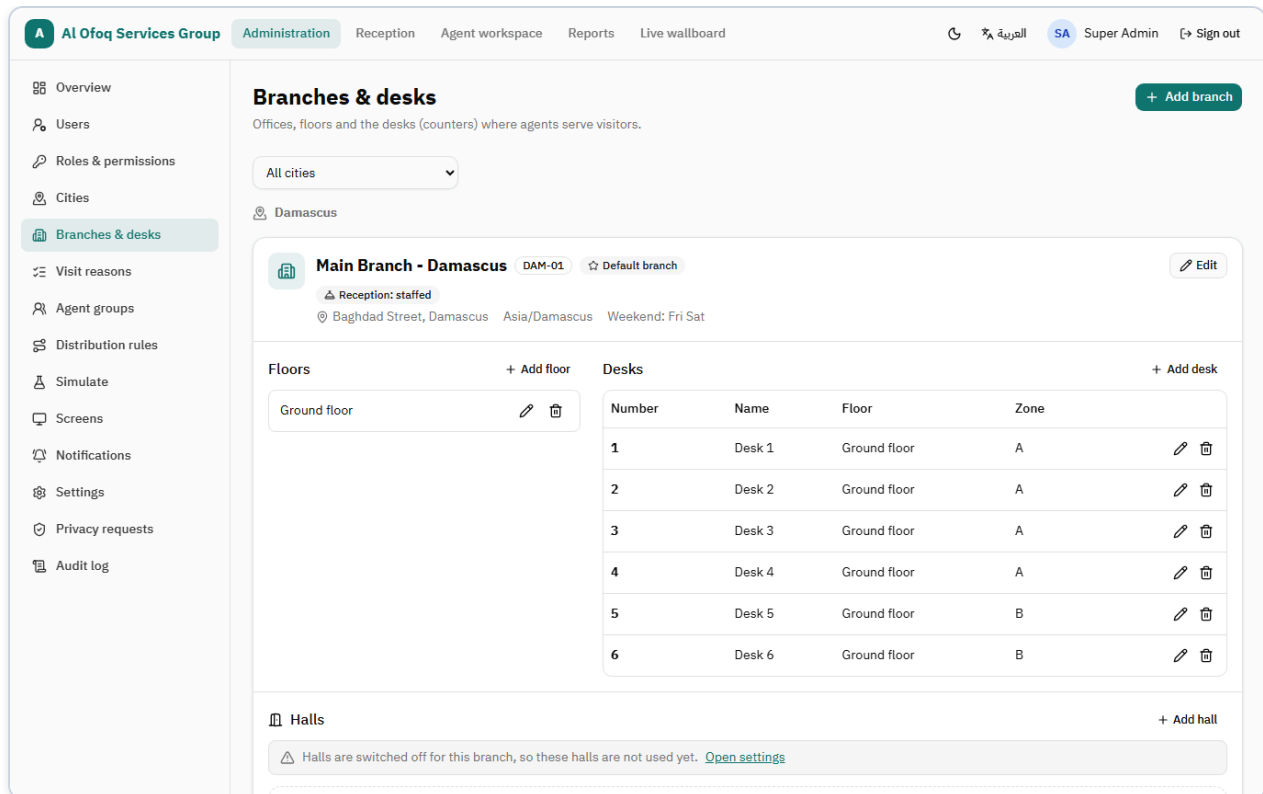

Each city card has a **Configuration** area. It shows how many settings the city overrides, how many branch overrides exist and how many visit reasons are hidden. Use **Open city settings** to change them. Use **Copy from another city** and **Copy configuration** to start a new city from an existing one. This replaces the new city's setting overrides and hidden reasons; branch overrides, shifts and message templates are not copied.

You can archive a city only when it has no active branches.

4.3 Add a branch, floors and desks

1. Open **Branches & desks** and press **Add branch**.
2. Choose the **City**, enter the **Branch code**, **Address** and **Time zone**. The time zone matters: the ticket numbering reset and the reports follow the branch's own time.
3. Tick **Default branch** if it should be the default. Save.
4. On the branch card, press **Add floor** if the building has several floors.
5. Press **Add desk**. Enter the **Number** (it is shown on screens and spoken, for example "Desk 3"), choose the **Floor** and, if you use multi-zone screens, a **Zone**.

Use the city filter at the top to narrow the list. If you use halls (rooms where one host receives several visitors together), add them in the branch's **Halls** block with **Add hall: Hall number**, **Capacity** (at least 2) and **Services accepted**. Halls only work once you switch them on in **Settings > Halls**.

Branches and desks

4.4 Create visit reasons and intake fields

A visit reason is a service, such as "Contract renewal". Every ticket belongs to one.

1. Open **Visit reasons** and press **Add reason**.
2. In **Basics**, enter the names, a **Code** (lowercase, used in reports) and the **Ticket prefix** (1 to 3 letters, Latin or Arabic, for example **A**). Choose the **Default priority**.
3. Under **Service targets**, set **Expected service time (min)** and **Target waiting time (SLA, min)**. The SLA is used by reports and ordering, and the expected time by the wait estimate.
4. Tick **Show first at reception** to make it a large button for two-tap issuing.
5. Under **Visitor information to collect**, tick only the fields you really need (visitor name, mobile number, company, last 4 digits of ID, email, notes). Press **Add custom field** for others. Fields you do not tick are not shown.
6. Under **Where it is served**, choose **Desk** (one visitor at a time) or **Hall** (several visitors together).
7. Under **Appointments**, tick **Allow appointments** if needed. Under **Self check-in kiosk**, choose whether visitors may type this service themselves or whether it **Needs a member of staff**.
8. Under **Who serves this reason**, press **Add agent** or **Add group**. For each, set the **Proficiency** (1 to 5) and mark them **Primary** or **Backup**. Backups receive tickets when primary agents are busy.
9. Save.

Warning: A reason with nobody assigned shows **Nobody assigned** in red: its tickets cannot be served until you assign someone.

You can archive a reason you no longer use. It disappears from reception, but history and reports keep it.

Visit reasons

Services visitors come for. Each reason has its own ticket prefix, targets, intake fields and agents.

☐ Show archived

Name	Ticket prefix	SLA	Expected service time (min)	Who serves this reason
General inquiry ★ general	A	10 min	5 min	3 assigned
Contract signing ★ contract	B	20 min	20 min	3 assigned
Complaint complaint	C	15 min	15 min	2 assigned
Document pickup ★ documents	D	10 min	5 min	2 assigned
Meeting with account manager account_manager	E	5 min	30 min	1 assigned

Visit reasons

4.5 Create users and agents

1. Open **Users** and press **Add user**.
2. Enter **Email**, **Full name**, **Mobile** and **Preferred language**.
3. Under **Roles**, press **Add role**. For each row choose the **Role** and the **Scope: Whole organization**, a city (all its branches) or a single branch. A city admin cannot choose the whole organization.
4. For people who serve visitors, switch on **Serves visitors** and set **Works at branch**, **Default desk** (or **Default hall** for a host), **Max tickets at once**, **Distribution weight**, **Groups** and **Shift**.
5. **Initial password**: type one, or leave it empty. If you leave it empty, Dor creates a set-password link, valid for 72 hours, and emails it to the user as an activation email (when email is configured). The link is also shown on screen so you can copy it if email is not set up.
6. Save.

Note: The activation, invitation and approval emails use built-in wording in Arabic and English. You do not need to write them.

Open any user from the list to edit them. The dialog also has these actions:

Action	Effect
Reset password	Signs the user out everywhere and creates a new single-use link valid for 24 hours. Also send by email sends it too.
Reset 2FA	Turns off two-step verification, for example when a phone is lost.
Sign out everywhere	Ends all of the user's sessions.
Deactivate / Activate	Blocks or restores sign-in. History is kept. You cannot deactivate yourself or the last administrator.
Anonymize	Permanently removes name, email, phone and picture. The account stays in history as a deleted user. Cannot be undone.

A padlock next to a user means the account is locked after too many failed sign-ins; **Activate** also clears a lock.

Users list

4.6 Invite people

An invitation lets a person choose their own password.

- 1. In **Users**, press **Invite**.

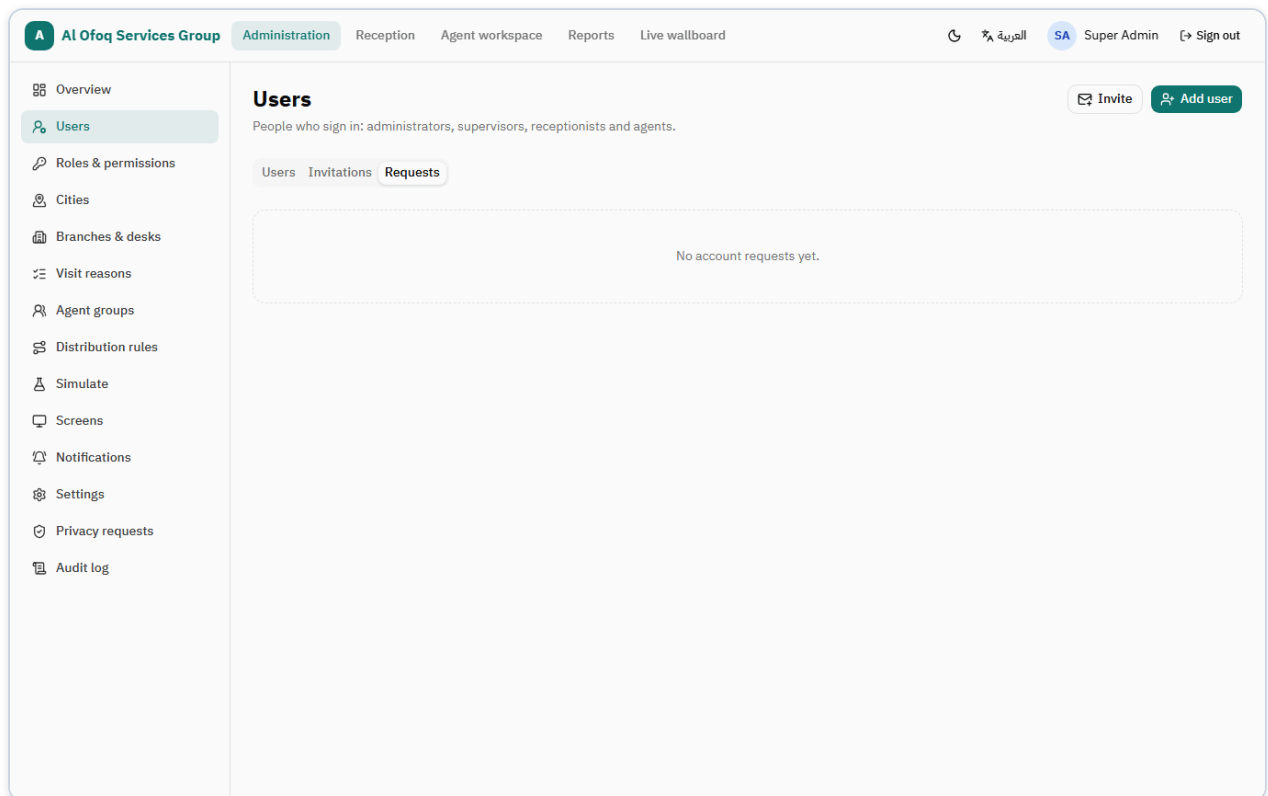

2. Enter the **Recipient** details (**Email** and/or **Mobile**) and the name.
3. Choose the **Role** and the branch, and the **Invitation language**.
4. Under **Send via** tick **Email**, **WhatsApp** or **SMS**, or choose **Copy link only**. Press **Create invitation**.
5. Dor shows the link. If a channel is not set up it says "is not configured. Copy the link and send it yourself."

Open the **Invitations** tab to follow each invitation: **Pending**, **Accepted**, **Expired** or **Revoked**. **Resend** creates a new link and the old one stops working. **Revoke** cancels a pending invitation. An invitation stays valid for the number of hours set in **Settings > Security > Invitation validity (hours)**.

4.7 Approve or reject sign-up requests

If you switch on **Let people request an account on the sign-up page (an administrator approves each request)** in **Settings > Security**, a **Request an account** link appears on the sign-in page. People fill in their name, email, phone and a password.

1. Open **Users** and then the **Requests** tab. A number badge shows how many are waiting.

The Requests tab with pending account requests

2. Press **Approve** on a request. Choose the **Role** and branch, then confirm. The person can sign in immediately with the password they chose and receives an email.
3. Or press **Reject**. The person is told the request was not approved, and may apply again.

Nobody gets access before you approve. Turn the setting off when you no longer want requests.

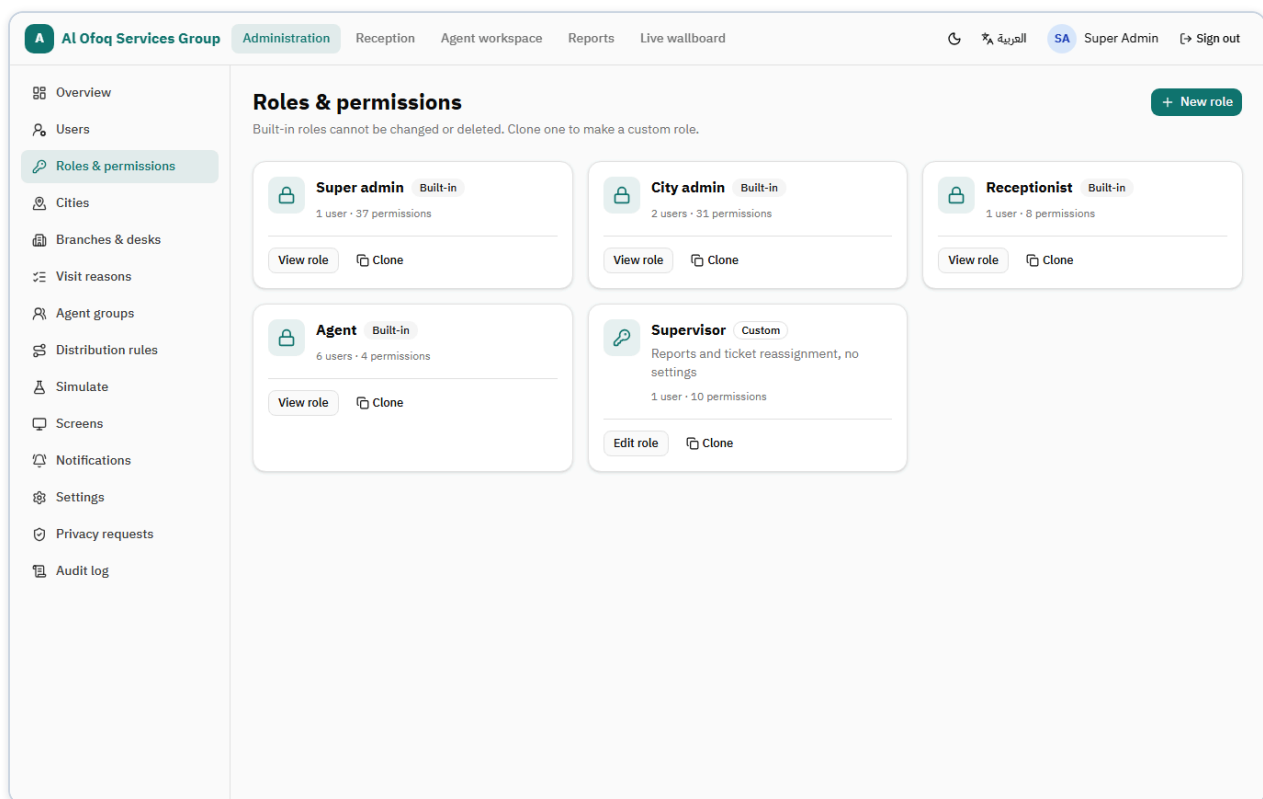

4.8 Roles and permissions

Open **Roles & permissions**. There are four built-in roles: **Super admin**, **City admin**, **Receptionist** and **Agent**. They are marked **Built-in** and cannot be changed or deleted. Your organization may also have custom roles marked **Custom**.

To make a custom role (super admin only):

1. Press **Clone** on a built-in role, or **New role**.
2. Enter the name and tick the **Permissions** you want. They are grouped (Administration, Users & roles, Organization, Services & distribution, Tickets & appointments, Agent, Reports & monitoring, Data protection, Integrations).3. Save.

Escalation rule: nobody can give a role, or put a permission in a role, that they do not hold themselves. A city admin therefore cannot give someone a role that contains organization-level permissions such as managing cities, settings or roles.

Roles and permissions

4.9 Agent groups

A group is a team, such as "Customer service". Assign a group to a visit reason instead of listing every agent.

1. Open **Agent groups** and press **Add group**.
2. Enter the name, choose the **Supervisor**, and add **Members**.
3. Save.

4.10 Shifts and breaks

- **Shifts:** **Settings > Agents**, press **Add shift**. Give it a **Code**, a start and an end. If the end is earlier than the start, the shift runs past midnight. A city has its own shifts as well as the organization's. Then assign shifts to agents in the user dialog.
- **How shifts are used** has three choices. **Ignored**: shifts are only labels. **Guide (recommended)**: used in reports, and agents outside their shift get no automatic assignments but can still be called manually. **Strict**: an agent cannot become available outside their shift and is signed out after it ends (with a grace period in minutes).
- **Break types:** **Settings > Break types** (super admin). Add types with a **Maximum minutes** and whether they **Count as productive time**.
- **Break limit:** **Settings > Break limit** limits how many agents of a branch may be on a break at once.

4.11 Distribution rules

Open **Distribution rules**. Use **Applies to** at the top to choose **All branches (default)**, one branch, or one visit reason in a branch. A narrower scope can override the default.

1. Choose the **Mode**:

- **Pull (bank style)**: tickets wait in the queue; an agent presses **Call next**.
- **Auto-assign**: each ticket is reserved for one agent at once, chosen by the strategy steps you set. Steps apply in order, each one breaking ties left by the previous one: **Least recently assigned**, **Fewest waiting tickets**, **Longest idle agent**, **Highest proficiency first**, **Weighted (agent weight)**, **Random**, **Strict rotation**.
- **Hybrid**: auto-assign, but if the agent does not call the ticket within the minutes you set, it is released to everyone and a supervisor can be alerted.
- **Manual**: the receptionist or a supervisor chooses the agent.
- **Round robin**: a fixed rotation; absent or full agents are skipped.

2. Tune **Order inside the queue** (weights for waiting time, priority and SLA pressure, appointment boost, priority lanes, a **Maximum wait guarantee**, **Aging steps**).

3. Set **Agent capacity**, **Overflow to backup agents**, **Returning visitors** (prefer the agent who served the visitor last time) and the **No-show policy** (automatic recall, then close the ticket or send it to the end of the queue).

4. Save. The message **Rules saved. They apply from the next ticket.** appears.

When a branch or reason has its own rules, the page says **This scope overrides the inherited rules**. Use **Remove override** to go back to the default.

Distribution rules

How tickets reach agents. Rules can be set for all branches, overridden per branch, or per visit reason. Changes apply to the very next decision, with no restart.

Try these rules in the simulator

Applies to: All branches (default)

Mode

- Pull (Bank style)**
Tickets wait in the nearest queue; any eligible agent presses "Take next" and gets the head of the queue.
- Auto-assign**
Each new ticket is reassigned for a specific agent immediately, chosen by the strategy below.
- Round robin**
Each new ticket goes to the next agent in a fixed rotation. An agent who is away or fully occupied will be later come on.
- Hybrid**
Auto-assign to the preferred agent; if they don't call it in time, release for everyone and pass to supervisor.
- Manual**
The supervisor or a supervisor chooses the agent for every ticket.

Returning tickets

After this ticket is closed, other tickets from this Agent should be available to work on.

Order inside the queue

The queue decides who is called next. Waiting time above = pure first come, first served.

Weight of waiting time (per release)	Weight of priority level	Weight of SLA pressure
1	1	1

Appointment based: 100
Repeat appointments into many minutes before that time: 10
Maximum wait guarantee (min, 0 = off): 60

☒ Serve priority lanes (e.g. VIP) before the regular line

Agent miss

After a missed call, how long is the ticket held for? If nobody is taking, it is forgotten.

After (min): 20 Add
After (min): 40 Add

Agent capacity

☒ Resolved (not yet called) tickets count toward an agent's maximum

Overflow to backup agents

☒ Let backup agents help when the queue is over the limits

Queue longer than: 10 Or oldest wait longer than (min): 20

☒ Backup also help whenever no primary agent is free

No-show policy

☐ Recall automatically

Send as no-show after (min, 0 = only missed): 10
Close the ticket as no-show: Yes

Auto-withdraw for accidental no-show / complete (seconds): 120

Distribution rules

4.12 Test rules with the simulator

Before changing live rules, try them on a pretend day.

1. Open **Simulate**.
2. Choose the **Branch**. For **Visitors**, choose **Generated day** (set the **Number of visitors**, **VIP share**, **Elderly share**) or **Replay a real day** (pick the **Day to replay**).
3. Select the **Agents**. Use **Extra generic agents (what-if)** to see the effect of more staff.
4. Under **Rules to compare**, keep **Current rules** and press **Add candidate** to add alternatives.
5. Press **Run simulation**. The **Results** table compares average, median and 90th percentile wait, longest wait, **Within SLA (%)** and **Fairness**, and marks the **Best** value. Charts show people waiting over the day and visitors per agent.

The simulator uses the same engine as the live system but changes no real ticket. From **Distribution rules**, the button **Try these rules in the simulator** takes you straight there.

4.13 Settings

Open **Settings** in the left menu: its sections appear as a dropdown list underneath, grouped as General, Visitors & tickets, Agents & service, Screens & reports, Security & privacy. Choose one to open it. A **Search settings...** box at the top of the page finds any option.

The **Applies to** switcher decides the level you are editing. Values are inherited from the organization, then the city, then the branch. For a section that allows it, switch on **Override for this city** (or branch) to give that level its own value. **Reset to default** removes the override. Each section shows where its current value comes from. A bar shows **You have unsaved changes**; press **Save** or **Discard**.

Section	What you set	Level
Branding	Company name, Logo (PNG, JPEG, WebP or still GIF up to 5 MB) and a separate Logo for dark backgrounds , primary and accent colours, font, welcome text, ticket footer	Organization
Language & calendar	Digits on screens, tickets and voice (Western or Arabic-Indic), time format (12 or 24 hours), phone country code, Show Hijri date	City
Tickets	Number digits (3 gives A-007), Separator , Daily numbering reset time , Print QR code on tickets	City
Reception	One-tap issuing, automatic printing, priority and language choices, what happens after issuing, whether agents can issue walk-in tickets	Branch
Self check-in	Kiosk on or off, printing, limits, services offered, welcome text	Branch
Wi-Fi	Guest Wi-Fi details printed on the ticket	Branch
Waiting time	How the estimate shown to visitors is worked out (fixed, per reason, or learned from real visits), rounding, safety margin, wording	Branch
Visitor page	The page opened from the ticket QR code, and when to notify the visitor	City
Feedback	Ask visitors to rate the visit (faces or stars), comment, recommend question, what counts as a low score	Branch
Priority lanes	Priority levels, their weight and whether they form a separate lane	Organization
Agents	Several visitors at once, shifts	City
Halls	Switch halls on, grouping, announcing	Branch
Break limit, Break types	Breaks	City / Organization
Wallboard	Look of the live wallboard and the waiting-room screens' default look	Branch
Reports	Service level minutes and target, target utilisation, forecast history	City
Alerts	Thresholds for long wait, queue size, idle agent, no-show spike, low satisfaction, and Email recipients	Branch

Section	What you set	Level
Security	See 4.15	Organization
Data retention, Data protection	See 4.17	Organization

The **service day**: the **Daily numbering reset time** (in **Tickets**) is the branch-local time at which ticket numbers start again from 1.

Two more options in **Tickets**:

- **Restart numbers after**: during the day, after this ticket number the next one starts again at 1 (set 100 and the line goes **A-100** , then **A-001**). **0** keeps counting until the daily reset. A number still held by a waiting visitor is skipped, so two visitors never share a number.
- **Call visitors by the last digits of their phone number** (with **Digits called**, 3 by default): for desks without a printer. Reception types the visitor's phone number and the screens and the voice call its last digits instead of the ticket number. Only the last digits are stored. Two visitors in the line cannot have the same digits.

4.14 Notifications and message templates

Open **Notifications**. It tells visitors their number, their turn and their call. It has four tabs:

- **Channels:** shows **WhatsApp**, **SMS** and **Email** as **Configured**, **Not configured** or **Test mode (nothing is sent)**. Provider keys and passwords are set by whoever installs the server (for email, the SMTP settings; for WhatsApp, the WhatsApp Cloud API token; for SMS, an SMS gateway or Twilio). They are never shown here. Use **Send a test message** to send a sample to your own phone or email (super admin).
- **Events and limits:** choose which events are sent (**Number issued**, **Turn is near**, **Called to the desk**, **Missed the call**, **Thank you after the visit**) on which channel, and the **Channel order**. Limits protect visitors from too many messages. Keep the **Opt-out footer**. Messages are sent only if the visitor agreed at reception and left a phone number or email. Branches can follow the default or have their own choice.
- **Messages** (super admin): edit the wording per event and channel, with values you can insert (ticket number, desk, wait and so on). **Restore the default wording** goes back to the original. For WhatsApp you can enter the **WhatsApp approved template name**.
- **Delivery log:** every message with its status (**Queued**, **Sending**, **Sent**, **Failed**, **Not sent**) and the reason when it was not sent. Use **Send again** on a failed one.

Notifications

4.15 Security settings (super admin)

In **Settings > Security**:

- **Password policy:** **Minimum length**, and whether to require an uppercase letter, lowercase letter, number or symbol.
- **Lock after failed sign-ins** and **Lock duration (min)**.
- **Invitation validity (hours)**.

- **Let people request an account on the sign-up page....**: see 4.7.
- **Roles that must use 2FA**: tick the roles. People in those roles must use two-step verification.

4.16 Reports and scheduled reports

Open **Reports** from the top bar (it needs the report permissions, which both administrator roles have). Choose a period (**Today**, **Yesterday**, **Last 7 days**, **Last 30 days**, **This month** or custom dates) and filters (branch, visit reason, agent, hall, hours, weekdays). The page shows key figures, peak hours, queue length, agents, visit reasons, forecast, repeat visits, shifts, ticket sources, halls and visitor satisfaction.

- **Download** exports **Excel (.xlsx)**, **CSV** or **PDF**, with the sections you pick.
- Open **Scheduled reports** at the bottom and press **Add scheduled report** to email a report automatically. Choose the **Frequency** (**Every day** covers the previous day; **Every week** covers the seven days ending yesterday), **Send at**, **File format**, **Report language**, branch, **Recipients** (one email per line) and sections. **Send now** tests it. If email is not configured nothing is sent.

4.17 Privacy tools and data retention

Privacy requests handles a visitor asking for their data.

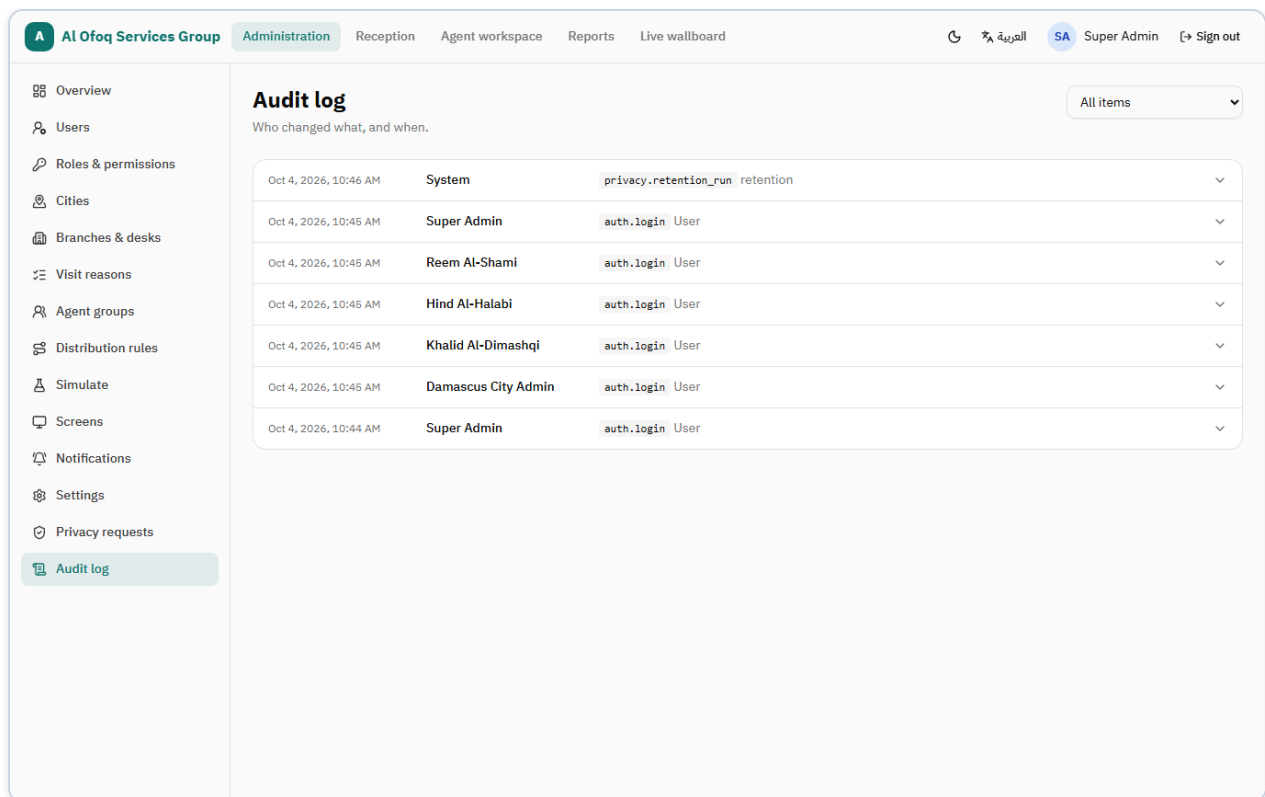

1. Open **Privacy requests**. Type a phone number, name or ticket number and press **Search**.
2. Select the visitor. You see what is held (tickets, appointments, feedback, notifications).
3. **Export JSON** or **Export CSV** gives the person their data.
4. To erase, press **Erase now**, write a **Reason** (no names or numbers), tick **I confirm the identity of the person and want to erase their data.** and confirm. Name, phone and company are removed and notes and comments are cleared. Tickets and scores stay in reports. This cannot be undone.

Every request is listed under **Request history** without the person's details. To remove a staff member's personal data, use **Anonymize** in the user dialog.

Retention (**Settings > Data retention**, super admin): set the number of days after which visitor data is anonymized, ticket notes and intake answers are cleared, feedback comments are cleared, notification details are cleared, audit entries are deleted and expired sign-in records are deleted. **0** keeps that data until you erase it by hand. The job runs by itself about once a day. **Preview** shows what it would change without changing anything. **Run now** applies it for good. **Settings > Data protection** holds the **Consent text on the reception form** and **Require consent before issuing a ticket**.

4.18 Audit log

Open **Audit log**. Each row shows **When**, **Who**, **Action**, **Item** and **Details**, with **Before** and **After** values for changes. Filter by item type with **All items** and press **Load more** for older entries. Use it to answer "who changed this setting?"

Audit log

4.19 Backups

Backups are taken by scripts on the server, not from this application. Ask whoever runs the server to schedule them, and read the file `docs/backup-restore.md`. The **Database backup** card on the Overview shows whether the last backup succeeded.

5. Good practice and tips

- Give each person the smallest role they need. Use a custom role such as a supervisor (reports, wallboard, reassign tickets) instead of making someone an administrator.
- Keep at least two administrators so you are never locked out.
- Set each branch's time zone correctly before the first ticket.
- Use **Simulate** before you change distribution rules on a busy branch.
- Check the **Delivery log** after you configure a channel, and send yourself a test message.
- Review the **Audit log** regularly, especially roles, users and settings.
- Collect only the visitor data you need and set retention periods.
- Make sure every visit reason has at least one primary agent and a branch has a way to issue tickets.

6. Common questions and troubleshooting

Problem	What to do
A page in this guide is not in my sidebar	Your role does not include it. A city admin has no Cities page and sees fewer Settings sections. Ask a super admin.
"Access denied"	Your role lacks the permission. Ask a super admin to change your role.
I cannot give a role to someone	You can only give roles whose permissions you hold, and only within your own scope.
Tickets for a service are never called	Open the visit reason: nobody is assigned, or the assigned agents are not signed in or are outside their shift (Settings > Agents).
A branch cannot issue tickets	The Overview warning card tells you why. Add a receptionist, enable agent walk-in issuing, or pair a kiosk.
New user did not get an email	Email may not be configured (Notifications > Channels). Copy the link from the dialog and send it yourself.
The invitation link stopped working	It expired or was replaced by Resend . Resend it.
A user is locked out	Open the user and press Activate , or wait for the lock duration. Use Reset password if needed.
A user lost their phone	Open the user and press Reset 2FA .
A setting change does not show at one branch	That branch may have its own override. Use the Applies to switcher and check the source badge.
Visitors do not get messages	Check the channel status, that the event is on, that the visitor agreed at reception, and the Delivery log reason.
Ticket numbers restarted at an odd moment	Check Daily numbering reset time and the branch time zone.

7. Quick reference

I want to...	Go to
Add a city	Cities > Add city
Add a branch, floor or desk	Branches & desks

I want to...	Go to
Add a service	Visit reasons > Add reason
Assign agents to a service	Visit reason > Who serves this reason
Create a user	Users > Add user
Invite by email, WhatsApp or SMS	Users > Invite
Approve an account request	Users > Requests > Approve
Reset a password or 2FA	Open the user > Reset password / Reset 2FA
Make a custom role	Roles & permissions > Clone or New role
Change how tickets are assigned	Distribution rules
Test rules safely	Simulate > Run simulation
Change logo, colours, numbering	Settings
Set password rules and 2FA	Settings > Security
Connect email, WhatsApp, SMS	Notifications > Channels (keys set on the server)
Edit visitor message wording	Notifications > Messages
Schedule a report email	Reports > Scheduled reports
Erase a visitor's data	Privacy requests
See who changed something	Audit log
Pair screens and kiosks, set voice	Screens (see the screens guide)

8. Going live checklist

Before the first day, make sure:

1. The **Company name** and **Logo** are set, and a test ticket looks right.
2. Every branch has the correct **Time zone**, desks with numbers, and a way to issue tickets (receptionist, agent walk-in issuing or a kiosk).
3. Every visit reason has a **Ticket prefix**, expected time, SLA and at least one primary agent.
4. All staff have accounts, the right role and scope, and agents have a **Default desk** and **Shift**.
5. **Distribution rules** are set and tried in **Simulate**.

6. **Daily numbering reset time**, digits and wait estimate are set.
7. **Settings > Security**: password policy, 2FA for administrators, invitation validity, and the sign-up setting decided.
8. Email is configured; WhatsApp and SMS if you use them. A test message arrived. Visitor message wording is reviewed.
9. Consent text and retention periods are set.
10. Screens, voice and kiosks are paired and checked (see the screens guide).
11. Backups are scheduled and the **Database backup** card is green.
12. At least two administrators exist, each with two-step verification.

Screen setup guide

1. Who this guide is for

This guide is for the person who installs and looks after the screens of Dor (دور): the waiting-room display screens that show which number is called, the self check-in kiosks where visitors take their own ticket, the live wallboard for supervisors, and the voice that announces each call. This is usually an administrator or a technician.

With this guide you can:

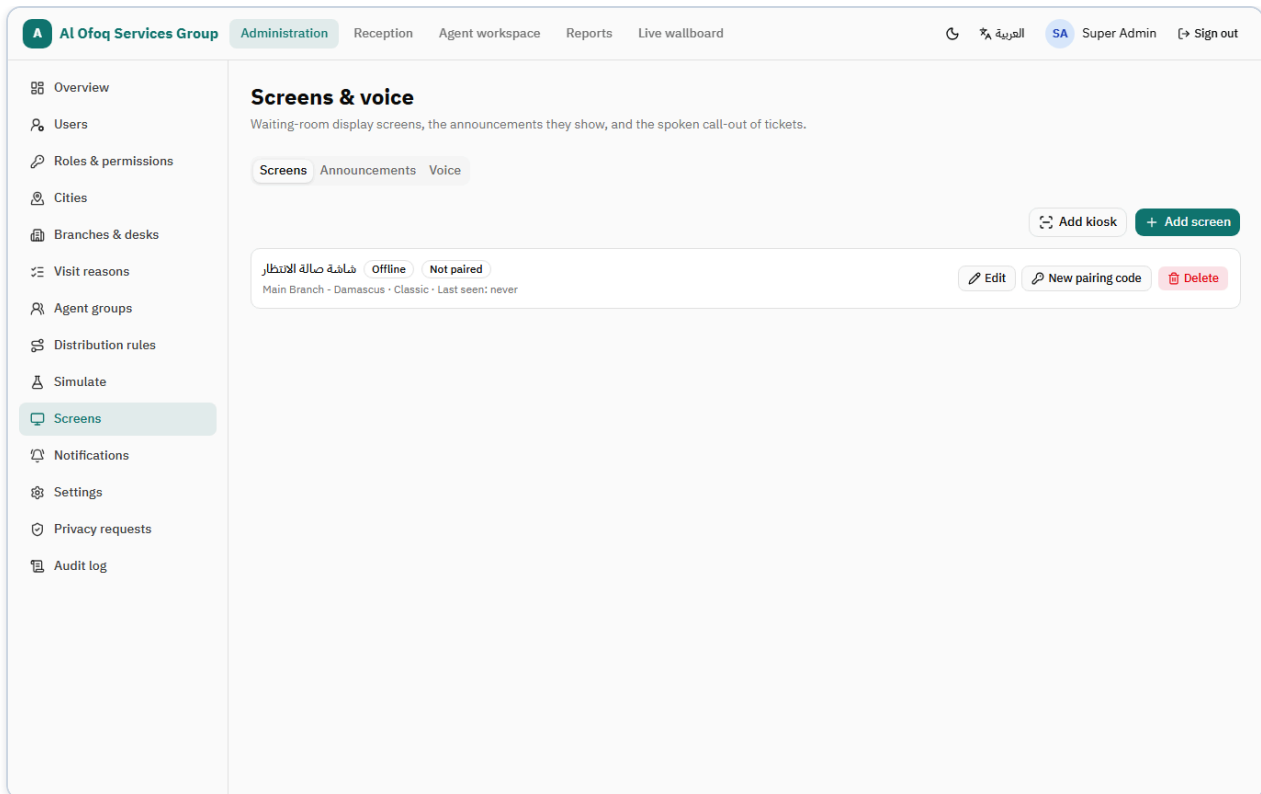

- Add a waiting-room screen, pair it with a TV or PC and choose how it looks.
- Add a self check-in kiosk and pair a tablet with it.
- Show news lines and slides on the screens.
- Choose the announcement voice, test it and fine-tune how a call is spoken.
- Set up the wallboard.
- Find and fix common problems (no sound, a screen asking for a pairing code again).

2. Before you start

- Sign in with your own account. You need the permission to manage screens. Without it, the Screens page shows "no access".
- The **Announcements** tab appears only if you may manage announcements. The **Voice** tab appears only if you may manage settings or templates. If a tab is missing, ask your administrator.
- You can use Dor in Arabic or English, and in a light or dark theme. Use the language and theme controls of the application. This does not change what the waiting-room screens show: each screen has its own languages and look.
- The screens and kiosks themselves need no sign-in. They are paired with a code (section 4).
- Make sure the TV or PC has a modern browser (Chrome or Edge is recommended), a network connection to the Dor server, and speakers if you want the voice.

3. Know your screen

Open **Admin** → **Screens** (الإدارة ← الشاشات). The page is called **Screens & voice** and has up to three tabs.

The Screens page with its tabs and the list of screens

The Screens tab

- **Add kiosk** and **Add screen** buttons at the top.
- One row per screen with its name, a **Kiosk** badge if it is a kiosk, **Online** or **Offline**, and **Paired**, **Not paired** or **Revoked**. Below the name you see the branch, the layout (or "Self check-in kiosk") and **Last seen**.
- Row buttons: **Edit**, **New pairing code**, **Open kiosk page** (kiosks only), **Revoke** (paired screens only) and **Delete**.
- The list refreshes by itself every 15 seconds. "Online" means the screen has contacted the server very recently.

The Announcements tab

Lines for the news ticker and slides that appear on the screens (section 4.9).

The Voice tab

Three parts, one under another:

1. **Voice settings**: what is announced, how many times, timing, sound, and a test area.
2. **Spoken phrases**: the sentence used by the browser voice.
3. **Audio packs**: pre-recorded voices.

What a screen looks like

A waiting-room screen is a full-screen page. It has a header with the clock and date, the call area (the latest call as large numbers, with the desk), a list of recent calls or desks, the waiting counts, rotating slides and a ticker line at the bottom. A small badge shows the connection state (**Connected**, **Reconnecting...**, **No network connection**) and whether sound is on.

Note: If the administrator turned on **Call visitors by the last digits of their phone number**, the screen shows **Phone ending in 472** (the last digits typed by reception) instead of the ticket number, and the voice reads those digits one by one. The recorded packs have no clips for that sentence, so the sentence voice or the browser voice speaks it.

4. Everyday tasks

4.1 Add a waiting-room screen and pair it

1. Open **Admin** → **Screens** and click **Add screen**.
2. Type a **Name** (for example "Main hall TV") and choose the **Branch**.
3. Choose the **Layout**:
 - **Classic**: the latest call large, recent calls in a list beside it.
 - **Single**: only the current call, as large as possible.
 - **Multi-desk**: a grid with the current ticket of every desk.
4. Choose the **Look of the screen**: **Use the default**, **Dark**, **Light** or **Brand colour**. "Use the default" follows the default look set in **Settings** → **Branding**.
5. Click **Save**. A window opens with a large **Pairing code** and the address of the screen.
6. On the TV or PC, open the browser and go to the address shown (it ends with `/display`). Type the code and press **Pair**. You can also open the address with the code added, for example `/display?code=ABC123` , which pairs without typing. This is handy when you set up a TV remotely.
7. The screen loads and starts showing the queue. On the Screens tab its badges change to **Online** and **Paired**.

Note: The code is valid for 15 minutes and can be used once. If it expires, click **New pairing code** on the screen's row to get another one.

Note: If someone enters a wrong code many times, the screen shows "Too many attempts, wait a minute and try again". Wait a minute.

4.2 Set what a screen shows

After the first save, click **Edit** on the screen. More options now appear.

Content

- **Arabic** and **English**: the languages shown. If you choose both, the screen switches between them. At least one language must stay selected.
- **Rotate every (seconds)**: how often the language and slides change (2 to 120; the default is 15).
- **Desk zones**: type zone names separated by commas to show only the desks and halls of those zones. Leave it empty to show all desks. Zones are the labels set on desks and halls.
- Tick or untick: **News ticker**, **Slides**, **Waiting list**, **Clock** and **Hall occupancy (3 / 8)**.

Voice on this screen

Leave these on **Inherit** to follow the general voice settings (section 4.6). Set a value only when this screen must be different, for example quieter:

- **Voice**: **Inherit**, **On** or **Off**.
- **Volume**, **Speech rate** (0.5 to 1.5), **Language of the call** and **Repeat (times)** (1 to 5).

Click **Save**. The screen updates by itself.

4.3 Prepare the TV or PC browser

Do this once for each screen device.

1. Open the display address and pair the screen.
2. Go full screen: press **F**, double-click the page, or click the corner button (**Fullscreen**). Press **F** again to leave full screen.
3. Sound: browsers block sound until someone touches the page. If the voice is on, the screen shows **Touch the screen to enable sound**. Touch the screen or press any key once. The badge then shows **Sound on**.
4. To avoid the touch after every restart, start the browser in kiosk mode with sound allowed. For Chrome, the start command has these options: `--kiosk --autoplay-policy=no-user-gesture-required`. Ask your IT team to set this as the startup of the device.
5. The screen asks the device to stay awake, so it does not go dark. Also turn off sleep and screen saver in the operating system.
6. Check the volume of the TV or speakers, and test with section 4.6.

Tip: The screen remembers its pairing in the browser. Do not clear the browser's site data on that device, and do not use a private window, or the screen will ask for a code again.

Tip: The mouse pointer hides itself after a few seconds without movement.

If the network drops, the screen keeps showing the last known state, shows **Reconnecting...**, and returns to normal by itself.

4.4 Replace a TV, re-pair or revoke a screen

- **New pairing code:** use it for a replacement device or a screen that lost its pairing. Enter the new code on the device. The old device stops working at once.
- **Revoke:** click **Revoke** and confirm **Revoke this screen?**. The screen stops working and returns to the pairing page until it is paired again with a new code. Use this for a lost or stolen device.
- **Delete:** removes the screen from the list for good (the device is also disconnected).

4.5 Add a self check-in kiosk

A kiosk is a tablet where visitors take their own ticket. It is paired like a screen.

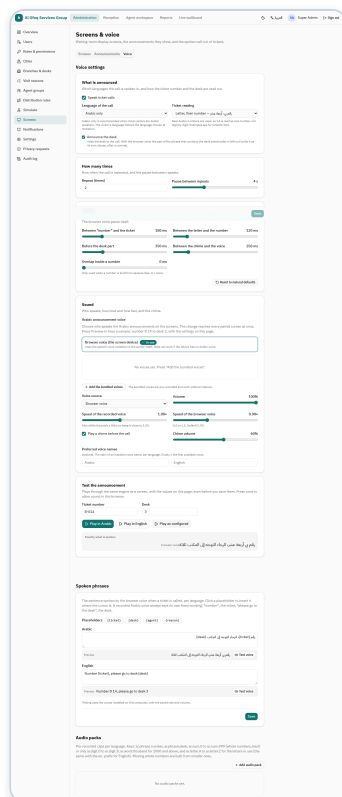

1. First open **Admin** → **Settings** → **Self check-in** and switch on **Self check-in is on**. Until it is on, a paired kiosk only shows "Self check-in is not available here. Please ask the staff to give you a ticket."
2. In the same tab you can also set: **Print the ticket**, **Show the estimated wait**, **Show a QR code to follow the ticket**, **Seconds before returning to the start**, **Most visitors waiting in the branch** (0 = no limit), **Tickets per minute per kiosk**, **Services offered** and **Welcome text on the kiosk**. A service that needs a staff member is shown on the kiosk as "Please ask the agent".
3. Go to **Admin** → **Screens** and click **Add kiosk**.
4. Type a **Name** and choose the **Branch**. Choose the **Languages: Arabic, then English, English, then Arabic, Arabic only** or **English only**. The first language is shown at the start and the visitor can switch. Choose the look (**Follow the screen theme, Dark, Light** or **Brand**).
5. Click **Save**. A pairing code appears.
6. On the tablet, open the address shown (it ends with `/kiosk`), type the code and press **Pair**.
7. Use **Open kiosk page** on the kiosk's row to see the kiosk page in a new tab.

What the visitor does on the kiosk: chooses a service, optionally types details (such as a name or mobile number, using the on-screen keypad), taps **Get my number**, and sees **Your number**, how many are ahead, the wait if enabled, and a QR code. After a few seconds the kiosk returns to the start. A visitor who already has a waiting ticket is shown that ticket again instead of a new one. If the line is full, the kiosk asks the visitor to see the staff.

For silent printing, start the kiosk browser with `--kiosk-printing` . Without it, the browser's print window opens.

Revoking, re-pairing and deleting a kiosk work like a screen.

4.6 Choose and test the announcement voice

The Voice tab of the Screens page

Open the **Voice** tab.

Step 1: choose who speaks Arabic. In **Arabic announcement voice**:

- **Browser voice (the screen device):** uses the voice installed on the TV or PC. It does not work if the device has no Arabic voice. Most PCs have none.
- **Recorded voices:** each card shows the voice name and its number of clips. Click **Preview** to hear a sample (number B 14 to desk 3), then **Use this voice**. The card then shows **In use**. The change reaches every paired screen at once.
- If the list is empty, click **Add the bundled voices**. The bundled voices are recorded in advance and work without internet.

Step 2: choose the voice source. In the **Sound** card, **Voice source** has three choices:

Choice	What it does	Needs
Browser voice	The device speaks with its own voice.	An installed voice for the language on each screen device.
Pre-recorded audio pack	Plays recorded clips for "number", the letter, the number and "please go to the desk". Works on any PC.	Nothing online.

Choice	What it does	Needs
Natural sentence voice (online)	Reads the whole Arabic call as one natural sentence with the neural voice that belongs to the voice you chose. It sounds the most natural.	The Dor server needs internet the first time each sentence is spoken (it takes a few seconds), then keeps it and plays it instantly. If the server cannot reach the internet, the recorded voice takes over automatically.

Note: The recorded and online Arabic voices are mainly meant for evaluation. Ask your supplier whether your licence allows using them in production.

Step 3: what is announced. In **What is announced:**

- **Speak ticket calls:** turns the voice on or off for all screens.
- **Language of the call:** **Arabic only**, **English only**, **The visitor's language** (the language chosen at reception), **Arabic, then English** or **English, then Arabic**.
- **Ticket reading:** **Letter, then number**, **Number only** or **Digit by digit**. The list shows an example for ticket B-014. Real Arabic numbers are used, so 14 is read as one number.
- **Announce the desk:** adds the desk to the call.

Step 4: repeats. In **How many times:** **Repeat (times)** (1 to 5, default 2) and **Pause between repeats** (default 4 seconds).

Step 5: timing (affects recorded voices). In **Timing** you can change the pause between "number" and the ticket, between the letter and the number, before the desk part, between the chime and the voice, and the overlap inside a number. If a call sounds unnatural, click **Reset to natural defaults**.

Step 6: sound. In **Sound:** **Volume**, **Speed of the recorded voice** (keep it close to 1.00), **Speed of the browser voice** (default 0.90), **Play a chime before the call**, **Chime volume**, and optional **Preferred voice names** for the browser voice (the start of an installed voice name for each language).

Step 7: test. In **Test the announcement**, type a **Ticket number** and a **Desk**, then click **Play in Arabic**, **Play in English** or **Play as configured**. The test uses the values on the page even before you save them, and shows **Exactly what is spoken**. Press once to allow sound in this browser. Click **Stop** to stop.

Step 8: save. Click **Save** at the bottom. While there are changes not saved, the page shows **Unsaved changes**. Choosing a voice with **Use this voice** is saved at once.

Tip: Test on the real screen too. Open the screen's address on the TV, call a test ticket from an agent workspace, and listen from the waiting area.

4.7 Edit the spoken phrases (browser voice)

The **Spoken phrases** part is the sentence the browser voice says, one for Arabic and one for English.

1. Edit the text. Click a placeholder (`{ticket}` , `{desk}` , `{agent}` , `{reason}`) to insert it where the cursor is.
2. Read the **Preview** line. Click **Test voice** to hear it with a voice installed on your computer.
3. Click **Save**.

Recorded Arabic voices and the online voice use their own fixed wording ("number", the ticket, "please go to the desk", the desk). If you switch off **Announce the desk** with the browser voice, write the desk part as its own clause after a comma, so it can be left out.

4.8 Audio packs

Audio packs lists the recorded voice sets. Most people only need **Add the bundled voices** from section 4.6. To add your own recordings:

1. Click **Add audio pack**.
2. Type a **Name** and choose the **Language**.
3. In **Clips (JSON)**, list each clip key and its audio file, for example `"ar.phrase.number":
"/audio/ar/number.mp3"`. Values start with `/` or `data:audio/`. The page tells you if the JSON is not valid.
4. Keep **Active** ticked and click **Save**.

Clip keys: `ar.phrase.number` , `ar.phrase.desk` , `ar.num.0` to `ar.num.999` , or only `ar.digit.0` to `ar.digit.9` , `ar.word.thousand` and `ar.letter.A` to `ar.letter.Z` (use the `en.` prefix for English).

Missing numbers are built from smaller ones. Use the pencil to edit a pack and the bin to delete it.

4.9 News ticker and slides

If you may manage announcements, open the **Announcements** tab.

1. Click **Add announcement**.
2. Choose the **Type: Ticker line** (text scrolling at the bottom) or **Slide** (a full panel with text and an **Image**).
3. Type the **Text** in Arabic and English. For a slide, you can upload an image up to 1.5 MB, and set **Slide duration (seconds)**.
4. Optionally set **Starts at** and **Ends at**. Without dates, it shows **Always shown**.
5. Save. A screen shows ticker lines and slides only if **News ticker** and **Slides** are ticked on that screen (section 4.2).

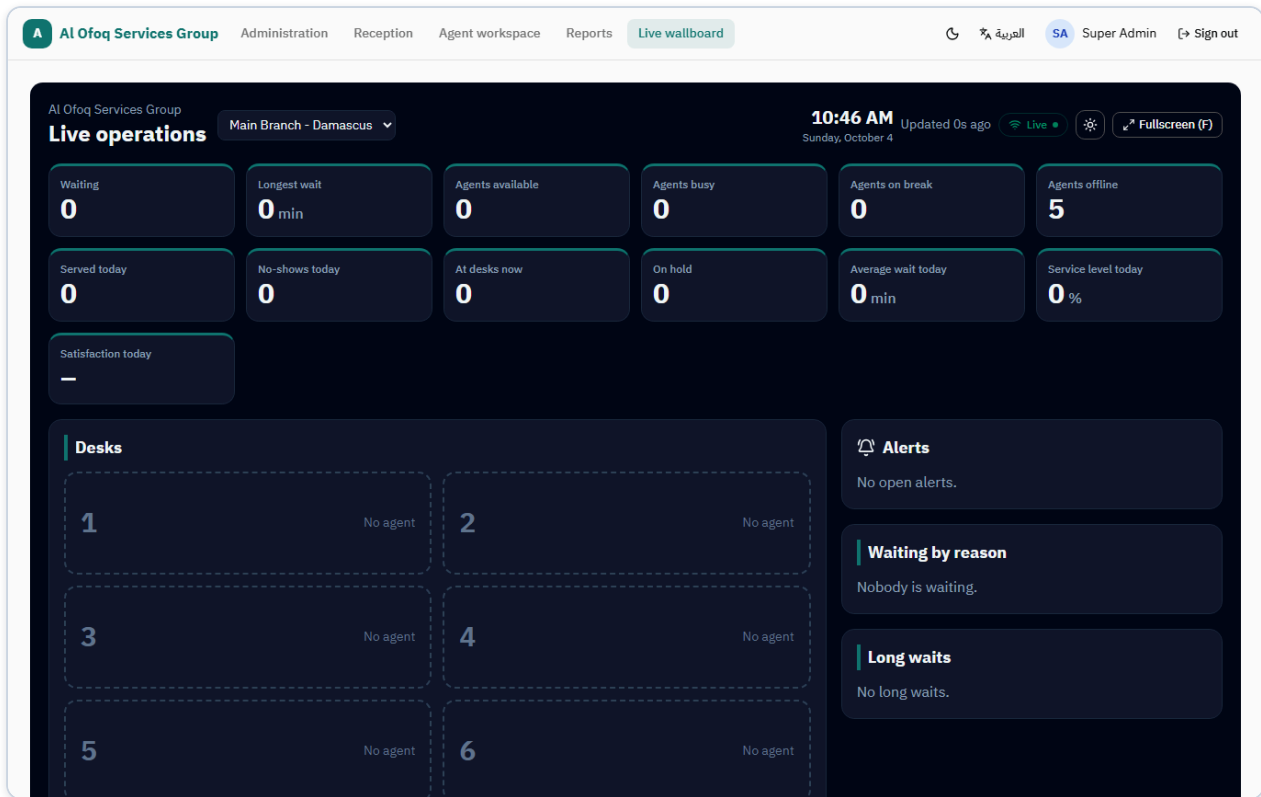

4.10 Group calls to a hall

If your organization uses halls, where one agent receives several visitors together, the screen shows the call as one card: "Hall 2" with every ticket number called. The voice reads the hall and the numbers. How the numbers are read is set in **Settings** → **Halls** → **How a group is announced: Read every number, Read as a range** or **Name the hall**

only. Call languages, repeats and pauses follow the voice settings above. **Hall occupancy (3 / 8)** on a screen shows how many visitors are in the hall.

4.11 The live wallboard

The wallboard is a live operations page for supervisors. Open **Live wallboard (لوحة المتابعة المباشرة)** from the area menu. It needs the wallboard permission.

The live wallboard

- Choose the **Branch** at the top. The page shows tiles (waiting, longest wait, agents available, busy, on break, served today, no-shows, and others), the desks with their current ticket, the halls, the waiting by reason, long waits and **Alerts**.
- Press **F** or use the **Fullscreen** button to fill a TV. Use the sun or moon button to switch to light or dark.
- The page updates by itself and shows **Updated ... s ago**. If it cannot load, it shows "Could not load live data. Retrying...".
- Supervisors who may manage alerts see an **Acknowledge** button on each alert.
- The look is set in **Settings** → **Wallboard: Look (Dark, Light** or dark tinted with the brand colour), **Text size (%)**, **Wallboard title (optional)**, and whether to show the logo, company name, branch name, clock and date, and today's visitor satisfaction.
- The wallboard shows ticket numbers and counts only, never visitor details.

5. Good practice and tips

- Give each screen a clear name that tells where it is ("Main hall TV", "Floor 2 corridor") so you can find it in the list.
- Use **Multi-desk** on a wide TV for many desks, **Single** when visitors stand far away, and **Classic** as a safe default.
- Keep **Arabic**, then **English** for mixed audiences, and set **Language of the call** to **Arabic only** if most visitors speak Arabic.
- Use desk zones when one branch has several waiting areas, each with its own screen.
- Always test sound after changing the voice, the repeat or the volume.
- Check **Last seen** and the **Online** badge from time to time. A screen that shows **Offline** needs attention.
- Keep screens and kiosks on a stable network connection. Use a wired connection when you can.
- Revoke any device that is lost, sold or moved to another site.

6. Common questions and troubleshooting

Problem	What to do
There is no sound on the screen.	Check that Speak ticket calls is on and that the screen's own Voice is not set to Off . Touch the screen once if it shows Touch the screen to enable sound . Check the TV volume and the volume setting. Start the browser with the autoplay option (section 4.3).
The screen says "Touch the screen to enable sound" after every restart.	The browser blocks sound until a touch. Start Chrome with <code>--autoplay-policy=no-user-gesture-required</code> , or touch the screen after a restart.
The call is silent in Arabic but works in English.	The device has no Arabic voice. Under Arabic announcement voice , choose a recorded voice and click Use this voice .
The page says "This device has no voice for that language".	Choose a recorded voice, or the online voice, or install a voice on the device.
The voice is the wrong one or has the wrong accent.	Choose another voice in Arabic announcement voice and press Preview . With the browser voice, set Preferred voice names .
The voice sounds like separate words.	Try Natural sentence voice (online) . Or use Reset to natural defaults under Timing .
The online voice is silent or slow the first time.	The server needs internet the first time each sentence is spoken. Check the server's internet access. Until then the recorded voice is used.

Problem	What to do
The voice is too fast or too slow.	Change Speed of the recorded voice (recorded) or Speed of the browser voice (browser). On one screen, set its own Speech rate .
The call is repeated too many or too few times.	Change Repeat (times) in the general settings, or on the screen's own settings.
The number is read digit by digit.	Set Ticket reading to Letter, then number or Number only .
The screen shows the pairing page again.	The pairing was removed. Common reasons: the screen was revoked, deleted or given a new code, or the browser's site data was cleared. Click New pairing code and pair again. Do not use a private window.
"The code is wrong or has expired".	Codes last 15 minutes and work once. Click New pairing code and enter the new code.
"Too many attempts, wait a minute and try again".	Wait a minute and enter the code again carefully.
The badge shows Offline or Reconnecting....	Check the network and the address. The screen keeps showing the last state and recovers by itself.
The screen shows a different language or too many desks.	Edit the screen: set Arabic and English , and Desk zones .
No ticker or slides on the screen.	Tick News ticker and Slides on that screen, and make sure the announcement is active and inside its dates.
The kiosk says "Self check-in is not available here".	Switch on Self check-in is on in Settings → Self check-in .
The kiosk says "We cannot reach the system".	Check the tablet's connection. The kiosk will not issue tickets without a connection.
The kiosk says "The line is full right now".	The Most visitors waiting in the branch limit was reached. Raise it (0 = no limit) or serve the queue.
A service on the kiosk says "Please ask the agent".	That service needs a staff member (for example it requires details a visitor may not type). Change this in the visit reason.
The screen goes dark.	Turn off sleep and screen saver in the operating system, and keep the screen in full screen.
I do not see the Voice or Announcements tab.	Your account does not have the needed permission. Ask your administrator.

7. Quick reference

Action	Where	What it does
Add screen	Admin → Screens → Screens	Creates a waiting-room screen and shows a pairing code.
Add kiosk	Admin → Screens → Screens	Creates a self check-in kiosk and shows a pairing code.
New pairing code	Row of a screen	A fresh 15-minute, single-use code.
Revoke	Row of a screen	Disconnects the device until it is paired again.
Delete	Row of a screen	Removes the screen.
Open kiosk page	Row of a kiosk	Opens the kiosk page in a new tab.
F / double-click	On a screen	Full screen on or off.
Layout	Edit screen	Classic, Single or Multi-desk .
Look	Edit screen	Use the default, Dark, Light, Brand colour.
Desk zones	Edit screen	Show only desks and halls of the listed zones.
Voice (per screen)	Edit screen	Inherit, On or Off , with own volume, rate, language and repeat.
Use this voice	Voice tab	Chooses the Arabic voice for all screens.
Voice source	Voice tab	Browser voice, recorded pack or online sentence voice.
Play as configured	Voice tab	Tests the call with the values on the page.
Reset to natural defaults	Voice tab	Restores the timing defaults.
Add audio pack	Voice tab	Adds your own recorded clips.
Add announcement	Announcements tab	Adds a ticker line or a slide.
Self check-in settings	Admin → Settings → Self check-in	Turns the kiosk on and sets its limits and wording.
Wallboard look	Admin → Settings → Wallboard	Look, text size, title and what is shown.
